But can the same necessarily be said for intelligence historians? Leaving aside fears about whitewashing and sycophancy, the recently published official histories of MI5 and SIS are truly exhaustive in their coverage; that is the official historian's privilege. When the official history of the JIC is released, little of the general outline will be left unsaid. With this, the original raison d'être of intelligence history—namely, to rescue from oblivion the gaps in knowledge—will appear tired and slow. As is the way of things, intelligence historians will have become settlers rather than pioneers, required to think reflexively about the nature of their enterprise. Arguably, less time will be spent *doing* intelligence history, and more *reflecting* on how it is done and where it needs to go.

A handful of areas seem deserving of more attention, however. So far, British historiography of intelligence—having grown out of traditional British political history, which frankly precludes an interest in the non-Western world—has neglected the role of intelligence services in imperial contexts, especially during the period of decolonization. Contrary to popular belief, the geographical scope of MI5's work has never been restricted to the metropole. The protection of British interests worldwide (diplomatic properties and staff; businesses and investments; and citizens living abroad) has long fallen within the remit of its functions. Both Philip Murphy and Calder Walton have made initial forays into this topic, demonstrating how the intelligence services attempted to gather information about indigenous groups, to police political opponents, and to extinguish "colonial fires," albeit with diminishing success in the 1950s.[80]

Although spy fiction is a subject well traversed in literary and film studies (exploring the formulaic nature of the genre, plot conventions, and the like), there has been conspicuously little attention by historians to the genre, specifically the important question of how its products relate to and reflect the real world of intelligence.[81]

The debunking of intrigue narratives has become a compulsory practice. However, as Wark implored over 10 years ago, the relationship between social reality and popular cultural construction should be addressed.[82] Rightly or wrongly, spy fiction has to a large extent shaped public perceptions of intelligence. Many retired SIS officers, including John le Carré, often admit to joining British intelligence as young men partly because they had been brought up on a fictional diet of swashbuckling yarns.

Despite the recent appearance of GCHQ: The Uncensored History of Britain's Most Secret Intelligence Agency*, by Richard Aldrich, what one might call the "SIGINT Project" has scarcely begun.*

According to KGB defector Oleg Gordievsky, the Central Committee of the Soviet Communist Party routinely watched James Bond films in the vain hope that its scientists could replicate "Q Branch" technology.[83] In the mid-1960s, mindful of a "spy fiction gap," the KGB attempted to win the thriller war by commissioning Bulgarian author Andrei Gulyashki to write a series of spy novels in which the "cerebral powers" and "analytical mind" of a self-styled major named Zakhov were pitted against James Bond's "ruthless, intuitive violence."[84] Needless to say, Bond is ultimately slain at the hand of his superior, morally clean Soviet adversary.

Despite the recent appearance of *GCHQ: The Uncensored History of Britain's Most Secret Intelligence Agency*, by Richard Aldrich, what one might call the "SIGINT Project" has scarcely begun.[85] In part, this is because the fast-paced world of covert action has been instantly more arresting to historians, and to their publishers, than has been the mundane setting of moth-eaten desk men combing transcripts of telephone conversations and burrowing in mountains of diplomatic correspondence.

It is also the case that much of the pertinent material has not yet been released. For many in the profession, therefore, the focus on HUMINT has been more a matter of necessity than professional preference. Yet Christopher Andrew has been especially critical of intelligence historians for failing to take account of SIGINT's contribution in the Cold War. Its continued absence, he argues, reflects widespread "cognitive dissonance" within the discipline—that is, reluctance among scholars to embrace a subject that would fundamentally challenge historiographical orthodoxy, not to mention their own career-hardened patterns of thought.[86]

The current crop of intelligence historians, suggests Andrew, are not the first to display cognitive dissonance with respect to SIGINT. In 1945, Sir Edward Travis, operational head of Bletchley Park and, later, director of GCHQ, was certain that scholars would soon discover the Ultra secret: "The comparing of the German and British documents is bound to arouse suspicion in [their] minds that we succeeded in reading the enemy ciphers."[87] The clues, it was assumed, were too obvious for historians to miss.

It was widely known that British cryptographers, under the direction of intelligence officer Reginald "Blinker" Hall, had cracked German codes during the Great War; indeed, Room 40's successful interception of the Zimmermann telegram, which accelerated the United States' entry into the war, had achieved extensive notoriety and fanfare in the press.[88] Held from November 1945 to July 1946, the Congressional Inquiry into Pearl Harbor had publicly discussed the accomplishments of "Magic," the cryptonym for American efforts to break Japanese military and diplomatic communications during World War Two.

Despite allowing for the enormous benefit of hindsight, the fact that no historian, for over a quarter of century, considered the possibility that the British had enjoyed similar success against Hitler's ciphers is remarkable. Just as baffling, when intelligence officer turned author Donald McLachlan disclosed Bletchley Park's secret codename—"Station X"—in his 1968 publication, *Room 39: Naval Intelligence in Action 1939–45*, it took another 6 years before historians finally connected the dots and started to consider with confidence the contribution of British cryptography to the Allied war effort.[89]

It is very important, however, that we also cast our net beyond the relationship between British intelligence and its partner agencies in Washington.

One of the biggest challenges facing intelligence historians is to resist the urge to study the British intelligence community in geographic isolation. For its sins, much of the existing literature is parochial and Panglossian; that is, accepting of the unique and incomparable make-up of British institutions, and reluctant to analyze thematic issues in a broader transnational context.[90]

Embedding the history of the British intelligence services in a comparative history of the 20th century intelligence revolution should reveal similarities and differences between particular national systems and thereby allow us to draw conclusions about general trends and dynamics. *The Hidden Hand: Britain, America and Cold War Secret Intelligence,* by Richard Aldrich, is an exemplar of comparative history, seamlessly shifting between two intelligence cultures and their institutions. By placing intelligence in a hemispheric perspective, Aldrich reveals not only the cohesion and unities of the Anglo-American "Special Relationship," but also the moments of "rancour and suspicion" that have threatened to derail its continuance. Nuanced, archivally rich, and theoretically informed—an unusual trifecta—*Intelligence Cooperation and the War on Terror,* by Adam Svendsen, is another recent example of historical writing that successfully manages to employ a comparative methodology.[91]

It is very important, however, that we also cast our net beyond the relationship between British intelligence and its partner agencies in Washington. During the Cold War, in a bid to monitor the Soviet Union and its satellites, the UK intelligence community often liaised with a range of non-Anglo-Saxon allies, including the West German Federal Intelligence Service (BND) and the French General Directorate for External Security (DGSE). The task of unpacking these relationships still awaits its historian.

The Evolution of US Army HUMINT: Intelligence Operations in the Korean War

John P. Finnegan

> ***"By the end of the Korean War, the Far East Command had fielded a large Army-controlled clandestine collection apparatus, closely linked with similarly large operations in the fields of partisan and psychological warfare."***

This article was originally published in a classified issue of Studies *(44, no. 2) in 2000. —ed.*

The traumatic experience of the Korean conflict was a watershed in the evolution of Army intelligence. Within six months, the Army found itself facing two major intelligence disasters: it was caught unprepared by the initial North Korean invasion of June 1950 and by the massive Chinese intervention in November of that year. In response, the Army hastily improvised a clandestine human intelligence (HUMINT) organization, building on a small existing intelligence unit, the Korean Liaison Office (KLO). By the end of the Korean War, the Far East Command (FECOM) had fielded a large Army-controlled clandestine collection apparatus, closely linked with similarly large operations in the fields of partisan and psychological warfare. More important, the Army had begun to take steps to create a permanent and professional HUMINT service that could carry out positive intelligence collection operations.

Lack of Intelligence

The sudden outbreak of the Korean war on 25 June 1950 came as a shock to US leaders. In hindsight, this is not surprising. Since the onset of the Cold War, the nation's intelligence assets had been targeted almost exclusively against the Soviet Union. In addition, intelligence responsibilities in the Far East were badly fragmented. General of the Army Douglas MacArthur's Far East Command (FECOM), the major theater headquarters in the area, no longer had any jurisdiction over the Korean peninsula: authority over the area had devolved to the Korean Military Advisory Group (KMAG) after the last American occupation forces left in mid-1949. Because the KMAG had no positive collection capability, Korea was an intelligence vacuum.[a1]

[a] For more on intelligence during this period, see Clayton Laurie, "A New President, a Better CIA, and an Old War," in *Studies in Intelligence* 54, No. 4 (December 2010) and CIA release of documents from the period in www.cia.gov/library/publications/historical-collections-publications/index.html.

All statements of fact, opinion, or analysis expressed in this article are those of the author. Nothing in the article should be construed as asserting or implying US government endorsement of its factual statements and interpretations.

In the field of intelligence, as in almost everything else, five years of peacetime occupation duty had left American forces in Japan less than well equipped to meet an outside challenge.

loughby, MacArthur's G-2, did maintain a residual intelligence organization in Korea, the KLO. The reports generated by this small office, however, received little attention in a preoccupied Tokyo. Similar reports submitted by an Air Force Office of Special Investigations (AFOSI) team that also remained in Korea were likewise disregarded. Intelligence emanating from the small CIA presence in Korea received an equally cool reception from FECOM. Intelligence that came the way of these elements was procured largely through liaison with Republic of Korea (ROK) sources. As such, it was deemed unreliable, and the information received was often conflicting. Intelligence officers back in Tokyo had heard "wolf" cried too often to believe that anything was actually going to happen. Lack of intelligence resources and hard data was paralleled by a lack of intelligence perception. Because the North Korean destabilization campaign against the South had failed, it was too easily assumed that the North would turn to political initiatives.[2]

The advance of T-34 tanks across the 38th parallel shattered the illusions of FECOM policymakers. The rapid collapse of ROK forces meant that only outside military help could prevent a communist takeover At the direction of the president and acting under the authority of the UN, FECOM quickly moved to intervene. But it found that in the field of intelligence, as in almost everything else, five years of peacetime occupation duty had left American forces in Japan less than well equipped to meet an outside challenge.[3]

On paper, FECOM controlled substantial intelligence assets. Willoughby had more than 2,500 intelligence personnel at his disposal, but these elements were organized to support an army of occupation. The largest single intelligence component within FECOM was the 441st Counter Intelligence Corps (CIC) Detachment, targeted against Japanese subversive elements. It reported to MacArthur in his capacity as Supreme Commander Allied Powers, not as head of FECOM. The four Army divisions in Japan had no organic CIC detachments.[4]

A large Military Intelligence Service Company of Japanese interpreters supported the 441st CIC Detachment, but there were only two Korean linguists at G-2's disposal. FECOM's Technical Intelligence Section had been discontinued in 1949. The PHOTINT capability of the command had shriveled. Cryptologic resources were equally lacking. The Army Security Agency, Pacific (ASAPAC) had two companies and two detachments in the Far East, but these were trained and equipped for fixed-site operations and could not easily be shifted to the field. ASA was not able to deploy a tactical unit in Korea until October, when a company was shipped from the United States.[5]

A Need for HUMINT

The adverse combat situation confronted by FECOM and the Eighth Army in Korea during the summer of 1950 created a critical need for hard intelligence. With other assets unavailable, this could only be provided by HUMINT. An organization was quickly built around the nucleus of the KLO, using personnel from the 441st CIC Detachment. To carry out its mission, the KLO hastily recruited Korean peasants, gave them sketchy training, and airdropped them behind enemy lines with instructions to return with intelligence reports. In addition, it set up Tactical Liaison Offices (TLOs) at division level to recruit Koreans as line-crossers to gather clandestine HUMINT.[a] Although it operated in support of Eighth Army and its tactical commanders, the whole structure remained firmly under Willoughby's control.[6]

Agent casualties were high, and the quality of intelligence produced unsatisfactory. But, in the early stages of the war, it

was all the UN forces had. Nonetheless, the KLO tried to improve the collection situation as early as August 1950. One basic problem was that both agent insertion techniques used by the KLO—parachute drops and line-crossing—were intrinsically hazardous, and even parachute agents had to exfiltrate through enemy lines to bring back their reports. The KLO came up with the idea of using small boats both to land its agents behind enemy lines and to retrieve them, thus bypassing the dangers of the fighting front. The cooperation of the ROK Navy was necessary for this effort, however, and this was difficult to obtain.[a] The whole idea was temporarily abandoned in September, when the needs of the forthcoming amphibious operation at Inchon absorbed all available shipping.[7]

By the time of the Inchon landing, the intelligence picture in FECOM was improving.

Some Improvement

By the time of the Inchon landing, the intelligence picture in FECOM was improving. The theater had received additional intelligence assets, and focus on the Korean problem at the national level was producing results. The rapid collapse of the North Korean Army appeared to make further efforts at establishing a permanent intelligence organization unnecessary. But the very success of UN forces exacted a price: intelligence elements repeatedly had to move to keep up with the pace of the advance, and this disorganized the intelligence structure and impaired its operational capabilities.

The Chinese Threat

The coming of November brought a new threat, the possibility of intervention by the People's Republic of China. Chinese Foreign Minister Zhou Enlai had publicly announced that China would enter the war if US forces crossed the 38th parallel. Although the United States had decided to ignore this threat as a bluff, American intelligence was aware that 400,000 troops of China's best formation, the Fourth Field Army, were being concentrated just across the Yalu River in Manchuria. Some of these forces crossed over into Korea in October and early November. Sharp clashes with UN troops ensued, and Army intelligence discovered the Chinese presence by finding that US and ROK forces had taken Chinese prisoners.[8]

The meaning of all this remained enigmatic. The Chinese soon disengaged, and the Chinese prisoners of war, when interrogated, claimed they were members of "Special Military Units" which at first were assumed to be only token cadres from the Fourth Field Army. While Army intelligence realized the Chinese did have the military capability for a full-scale intervention, it doubted they would pursue such a course. If the Chinese had failed to intervene in August, when the Eighth Army was trapped in the Pusan perimeter and intervention could have been decisive, it seemed irrational for them to intervene when North Korea had been broken. It appeared more plausible to assume the Chinese presence in Korea was in the nature of a face-saving gesture.[9]

The hard fact was that FECOM again found itself reduced to speculation about enemy intentions because it still lacked the intelligence resources needed to resolve the

---

[a] Of the early parachute agents, Marshall noted that "Frequently the Commanding General's plane was used to carry these men into nowhere." The TLO, as one officer put it, was basically a "glorified reconnaissance unit" designed to obtain order of battle information by using agents to conduct shallow penetration missions. To ensure it remained under GHQ FECOM control, the TLO was also assigned a notional strategic intelligence mission. Agents were a mixed bag whose numbers included high school-age children, women, the aged, and deserters from both the North and South Korean armies.

[a] Marshall grimly noted that in these operations, "Only the loss rate fulfilled expectations." Returning agents ran the risk of being mistaken for enemy infiltrators and shot by troops from their own side.

At this critical juncture, FECOM turned once more to clandestine HUMINT to meet its pressing need for intelligence.

problem. Manchuria was off-limits to photographic reconnaissance because of diplomatic considerations, limited aerial surveillance of Korea was unproductive, and other sophisticated collection mechanisms were targeted exclusively against the Korean problem and lacked the linguistic and technical capability to switch quickly.[10]

With his armies on the threshold of victory—the vanguards of the Eighth Army were across the Chongchon River in western Korea, those of X Corps nearing the Yalu in the East—MacArthur was in no mood to be deprived of triumph by the mere specter of a Chinese Army. He decided to subject the question of just what Chinese intentions might be to an acid test. On 24 November 1950, he ordered his widely dispersed forces to attack into the unknown.[11]

KLO Handicaps

The UN offensive ran head-on into 30 Chinese divisions that had secretly crossed over from Manchuria. The attack became a fighting retreat. The Eighth Army fell back from the Chongchon with heavy losses; X Corps began the difficult process of cutting its way back through the mountains to the port of Hungnam. By mid-December, as UN forces continued their retreat, the Chinese once more disengaged. Pursued by an overwhelming force, the Eighth Army found itself completely ignorant of how this force was disposed or where it might be attacking next.[a 12]

At this critical juncture, FECOM turned once more to clandestine HUMINT to meet its pressing need for intelligence. But the KLO organization (now officially titled the Far East Command Liaison Group, Korea) was in no condition to meet the requirements. There were no agent assets in the areas in which the Chinese were advancing. The KLO did have the capability of inserting parachute agents in "blind drops," using Air Force C-47s, but the AVIARY program, as it was called, operated under severe disabilities. The standard of agent training was low, and the KLO had no radios suitable for agent work and no agents trained in radio operation. In a desperate attempt to clarify the tactical situation, the KLO was reduced to dropping 12 two-man agent teams equipped with smoke grenades north of UN lines to establish the location of the Chinese forces. Only a few teams ever managed to signal Air Force spotter planes, all with negative results.[13]

[a] Upon assuming command of the Eighth Army, Gen. Matthew B. Ridgway recalls that all he had in the way of intelligence about the enemy north of his lines was a map showing "A big red goose egg...with '174,000' scrawled in the middle of it." The situation did not quickly improve; in February 1951, Ridgway reported that, "We have a curtain beyond the range of our immediate combat intelligence activities which I find extremely difficult to pierce."

The 442d CIC Detachment

In these darkest days of the war, FECOM responded to the intelligence challenge by setting up a new unit to conduct an expanded program of clandestine HUMINT. The 442d CIC Detachment was activated on 20 December 1950 in Seoul with 50 assigned personnel to take over operational control of the KLO central office and the division level TLOs. On paper, the 442d was a normal CIC unit, organized under a standard cellular Table of Organization and Equipment (TOE 30-500) and commanded by a regular army officer, Col. C.A. Dickey. In reality, it was a highly unusual organization assigned a positive clandestine collection mission that went far beyond the CIC's normal responsibilities.[14]

The 442d had a turbulent beginning. Two days after the unit was officially activated in Seoul, the deteriorating military situation forced it to establish a rear headquarters in the city of Taegu. The rest of the headquarters soon followed to escape the second Communist occupation of the South Korean capital. But the rapid revival of the Eighth Army's fortunes

under its new commander, Gen. Matthew B. Ridgway, put an end to further UN retreats. Working from a secure base, the 442d was able to upgrade the FECOM clandestine HUMINT program between January 1951 and the first armistice negotiations in June, making significant accomplishments in the areas of agent insertion, communications, and training.[15]

Until early 1951, agents had been inserted by line-crossing and by parachute drop. At the TLO level, hundreds of Korean peasants were sent to gather limited information about enemy dispositions in front of the UN lines. The KLO had its own line-crossers; it also paradropped smaller numbers of Korean agents on long-range collection missions, using Air Force AVIARY C-47s controlled by Eighth Army's Special Activities Mission. Both techniques resulted in heavy losses of agents.[a] To remedy this situation, the 442d began to supplement its ground and parachute insertion methods by using boats to land agents behind enemy lines, a course first suggested in the summer of 1950.[16]

At the same time, the 442d CIC Detachment's headquarters element implemented a much larger program of amphibious espionage and was given the codename SALAMANDER.

SALAMANDER

Confronted by an unacceptable loss rate among their line-crossers, the TLO teams of the 3d and 25th Infantry Divisions began transporting agents by small boats around the enemy's flank on the west coast of Korea. At the same time, the 442d CIC Detachment's headquarters element implemented a much larger program of amphibious espionage and was given the codename SALAMANDER. This involved the use of Korean-manned fishing boats to insert long-range agents deep within enemy territory. SALAMANDER operations were initially conducted from the numerous islands off the Korean west coast that were to the rear of the enemy's lines. These islands were rendered more or less secure from hostile attack by the UN naval blockade, and many were already in the hands of anti-Communist North Korean partisans.[17]

The first SALAMANDER operations were mounted from the island of Paengyong Do, just below the 38th parallel. They soon moved to a more advanced base at Cho Do, strategically located just five miles off the North Korean coast. The position gave the 442d's agents access to the whole west coast of Korea up to the Yalu River. To complement this west coast operation, the 442d later initiated plans to establish an east coast SALAMANDER base on the bleak and inhospitable island of Yodo. This move would provide intelligence coverage of another enemy flank, as well as allow agents to provide extensive lateral coverage of North Korean positions, because they could land on one coast and exfiltrate from the other. Because the native fishing boats used by the operation were both small and unseaworthy, the 442d quickly took steps to secure fast American craft.[18]

Better Communications

Agent communications were also improved. Until the end of December 1950, radios had been unavailable, and the 442d's agent handlers were forced to wait until an agent actually returned to base before they could procure any intelligence. The situation gradually improved in 1951. Radio teams equipped with SCR-300 walkie-talkies were provided for both AVIARY and SALAMANDER operations.

[a] Parachute operations were particularly costly: a former AVIARY operations officer estimated that only 20 percent of agents dispatched managed to make it back to UN lines. (However, he thought it possible that an unknown number of the agents who failed to return were stranded North Koreans who had used AVIARY as an airline ticket home.) Until agents could be furnished radios, these operations also involved long delays in procuring intelligence: because of the distances involved, paradropped agents commonly took two to three months to complete their missions.

The growing efficiency of FECOM's clandestine HUMINT operations was paralleled in other intelligence fields, as language and other problems were resolved.

agents to furnish Army intelligence with information on a real-time basis. But this was not a panacea. Voice radio had its limitations; its short range meant that relays had to be used—SALAMANDER agents passed their messages through the Cho Do base—or that aircraft had to hover in the immediate area of the agent radio teams, risking compromise of the mission. An additional complication was that some of the Air Force crews who provided communications support to AVIARY operations were inexperienced because they flew the mission for an average of only two weeks. Many agent radio teams were lost. Continuous wave (CW) radios, with their longer range, would have helped, but agents had not yet been trained in Morse code.[a] [19]

On the other hand, at least agents were now provided with some minimal training. In March 1951, the 442d set up a training school at Pusan that provided 20 agents at a time with a basic two-week course of instruction. (The facility moved to Taegu in June.) After com- went to the TLO teams and the 442d's central office. Unsurprisingly, American intelligence personnel rated the new breed of agents as "far superior" to their predecessors. For example, reports noted that the new agents "appear to be enthusiastic" and "have a basic idea of the mission."

Better training seems to have been partially offset by increased enemy security measures. Line-crossing continued to be a hazardous operation, and agent capture rates increased, although a surprisingly large number of detained agents were able to escape and make it back to UN lines. At any rate, the new recruitment and training program made it easier to obtain replacements.[20]

Improved Capabilities

The growing efficiency of FECOM's clandestine HUMINT operations was paralleled in other intelligence fields, as language and other problems were resolved. The overall improvement of intelligence capabilities took place during a period when the Eighth Army's fortunes were on the upswing. As early as mid-January 1951, UN forces had been able to mount a limited counterattack. In March, Seoul was recaptured. While MacArthur was relieved for insubordination in April and replaced by General Ridgway, UN forces continued to push the enemy back across the 38th parallel. On 23 June 1951, the Soviet UN Ambassador announced that North Korea was now interested in peace talks, and Ridgway offered armistice negotiations to the enemy commander.[21]

Peace was not at hand, however. Although peace talks began and the UN forces halted their advance, there was no ceasefire. Negotiations dragged on for two years, accompanied by a static war of attrition in which hills changed hands from time to time in bloody skirmishes while the main battleline remained stable. No longer forced to respond to the intelligence crises of the moment, FECOM began to build up an elaborate semipermanent clandestine HUMINT structure to meet the needs of a new kind of war.

The Liaison Detachment

The new effort was conducted under a revised organizational structure. The 442d CIC Detachment was inactivated on 26 July 1951, and its personnel and assets transferred to a new organization, the 8240th Army Unit. (In addition to its Korea-based assets, the 8240th consisted of a headquarters element in Tokyo and a logistic element in Sapporo, Japan.) The former KLO/TLO organization now became known as the Far East Command Liaison

[a] Twenty UHF-VHF air-sea rescue sets had been acquired in mid-December but had arrived without operating manuals and proved to be of insufficient range to be useful. Once voice radios became available, airborne radio control support was provided by the C-46s of the 438th Troop Carrier Command staging out of Japan.

Detachment, Korea. The Liaison Detachment, commanded by Col. William I. Russell, had an authorized strength of 104. Because of a shortage of intelligence specialists, and the Army's decision to return gradually all CIC personnel to their normal assignments, it took some time to gather the necessary numbers. Colonel Russell started out with only the 50-odd people he had inherited from the 442d.[22]

The tight personnel situation led to a new development in agent training—agent nets—that were set up by the summer of 1951. These consisted of permanent agent organizations behind enemy lines, linked to headquarters by radio control and supplied and reinforced by SALAMANDER and AVIARY operations. These nets were now entrusted with training, thus allowing the school at Taegu to be shut down. Under the new arrangements, each net recruited its own agents (many from the large refugee camps on the island of Koje-do), put them through a two-week training course, and sent them to the frontline TLO teams for assignment in the field. Agents who successfully completed five line-crossing missions were given two weeks of additional training and then went into the SALAMANDER or AVIARY programs.

The new approach was not completely successful. In practice, only 25 percent of agents managed to complete as many as four line-crossing missions for the TLOs. Centralized training was revived in October, when three nets were consolidated and a new school set up in Seoul. Ultimately, a compromise between the two approaches was reached: the nets provided basic agent training and the school became responsible for advanced radio and parachute training.[23]

By the summer of 1951, it was at last possible to set up a 10-week Morse code course for agents, which permitted the nets to use long-range CW radios.

New Sources of Agents

In addition, the Liaison Detachment found new sources from which to procure agents. A Korean religious group with many adherents in the North, the Chando Kyo, was tapped to provide an agent network. Chinese POWs who rallied to the UN side were dispatched on order of battle missions. Finally, the Liaison Detachment acquired 124 agents formerly employed by the ROK Army's Headquarters Intelligence Division (HID). These agents had been operating from bases on the Korean east coast, both at Yodo, where there were already Liaison Detachment operatives, and on islands in Wonsan Harbor. Because the HID had run out of funds, the US Army picked up the tab and the people.[24]

The Liaison Detachment also further improved agent communications. By the summer of 1951, it was at last possible to set up a 10-week Morse code course for agents, which permitted the nets to use long-range CW radios. By September, an elaborate communications system was in place. A network of safehouses forward of UN lines received intelligence reports from agents via voice radio. The reports were then relayed back to the various TLOs by means of Morse code. The safe houses employed SSR-5-R CW radios; the TLOs were equipped with the standard Army AN/GRC-9's. Message traffic was then passed on by the TLOs to Liaison Detachment headquarters. The main SALAMANDER base at Cho Do communicated with headquarters and its west coast agents by similar means.[25]

By the fall of 1951, the Liaison Detachment began to reevaluate its procedures for inserting long-range penetration agents. The SALAMANDER operation, which used boats to land and retrieve agents, had been very successful. By contrast, the AVIARY program, which dropped parachute agents deep within enemy territory and then required them to make it back to UN lines on their own, produced less satisfactory results. Although AVIARY operations were intensively pursued—111

The Liaison Detachment thus became a miniature Army version of the World War II OSS, with responsibilities for secret intelligence and special operations,

ing a single month—the rate of return was discouragingly low. At one point in October, the Liaison Detachment contemplated reducing its airborne operations by 50 percent. Instead, it decided to adopt a new technique. Agents would be dropped in teams close behind enemy lines, wearing enemy uniforms and carrying small arms. In this way, they could impersonate enemy patrols and, if necessary, shoot their way back to UN lines. Use of this tactic, along with better screening of agents and more specific intelligence assignments, greatly reduced losses and gave AVIARY a renewed viability.[26]

CCRAK and the Liaison Detachment

The Army's clandestine HUMINT effort in Korea had now become part of a wider secret war, waged on an extensive but uncoordinated basis. In parallel with the Liaison Detachment's operations, the Eighth US Army was supporting a growing partisan effort on the Korean west coast that was based on the same islands that served as SALAMANDER bases. These islands also provided bases for various clandestine operations undertaken by the US Air Force, which used them to gather intelligence and to support the escape and evawas another player in the secret war.[27]

To better coordinate these fragmented efforts, a new theater-level structure was created on 10 December 1951, called the Combined Command for Reconnaissance Activities, Korea (CCRAK). CCRAK was an umbrella organization set up to impose centralized control on the secret activities of the armed services, the CIA, and the ROK allies. At the same time CCRAK was formed, the Army decided to place all its covert and clandestine efforts under a single headquarters. The Eighth Army's 8086th Army Unit, which had been running the partisan effort, was dissolved. The Liaison Detachment took over its functions and assets.[28]

The Liaison Detachment thus became a miniature Army version of the World War II OSS, with responsibilities for secret intelligence and special operations, the first time these two functions had been combined in a single Army organization. The arrangement had a certain logic to it. In accordance with existing doctrine, it moved control of partisan warfare from the field army to the theater level. The reorganization also provided the Liaison Detachment with a partisan force that could protect its island bases and provide it with supplementary intelligence reports. And the Liaison Detachment was finally in a position to prevent partisan operations from inadvertently jeopardizing intelligence activities.[29]

More Manpower

This increase in the Liaison Detachment's responsibilities brought with it an increase in personnel. By February 1952, the Detachment had 150 assigned or attached personnel on board; by the time a ceasefire was finally concluded in the summer of 1953, the Detachment had a strength of 450. (Even then, there were complaints that the Detachment still had too few intelligence personnel to fulfill mission requirements.) While Army strength in Korea remained stable from 1951 on, the proportion of resources devoted to intelligence and covert activities was much expanded. Because UN policy ruled out additional territorial gains on the battlefield, the secret war was the only combat arena in which efforts could be intensified.[30]

A good part of the growth permitted by this strength increase went into expanding the clandestine HUMINT effort. By 1953, a large, formidable organization had been fielded. The Liaison Detachment's Intelligence Division controlled five separate Intelligence Commands. Each had its own geographic area of responsibility

(although one command conducted operations on both coasts of Korea and across the frontlines), but the commands were also allowed to penetrate North Korea, Manchuria, and China proper to the extent their resources permitted. The five commands directed the activities of 17 separate agent nets, all with radio links to the appropriate command headquarters.

No fewer than 2,100 agents reported to the Liaison Detachment. Badger Net alone had 450 agents. Three hundred of these were in North Korea, either in permanent cells or as temporary inserts; the rest were at headquarters, in training, or in reserve.[31]

Intelligence Production

The nature of the game meant that the structure was not perfect. The necessity of setting up a clandestine organization in a denied area under wartime conditions had forced compromises both in administration and in the caliber of recruited agents. (In light of the fact that it was not until 1953 that TLO agents received the same pay as day laborers working for the Eighth Army, the latter deficiency is particularly unsurprising.) Some nets produced only inconclusive results, and no evidence exists that any were able to supply high-level intelligence on enemy plans.

Nevertheless, by the end of the war the Liaison Detachment had become the chief producer of HUMINT for the whole CCRAK organization, furnishing up to 1,000 intelligence reports a month, most graded by consumers as being of significant importance. This represented a five-fold increase over the detachment's output in 1951. The Liaison Detachment's contribution to CCRAK was as great as that of the Air Force's clandestine service, ROK Army G-2, and the CIA's collection element combined.[32]

The Korean agents bore most of the costs and risks, and their losses had been high, especially in the first stages of the effort.

Paying a Price

This elaborate clandestine HUMINT apparatus was not built without a certain price. The Korean agents bore most of the costs and risks, and their losses had been high, especially in the first stages of the effort. But Liaison Detachment personnel also met their deaths trying to insert agents. An Air Force C-46 went down over North Korea one night in February 1952, carrying three Detachment personnel, seven Air Force crewmen, and six Korean agents and an interpreter.

In April 1953, the ill-omened Fizzle Net, operating from Yodo on the east coast under the 4th Intelligence Command, ceased to exist when the American lieutenant serving as project officer was ambushed and killed with his agent party in a landing attempt that went awry.[33]

Partisan Warfare

The expansion of the partisan operation that the Liaison Detachment had taken over from the Eighth Army at the end of 1951 was even more striking. The private army of guerrillas inherited by the Liaison Detachment originated in the various groups of anti-communist refugees from North Korea who had fled to the islands off the western coast of Korea in the winter of 1950-1951. The Eighth Army had taken these groups in hand in early 1951 and used them to form a partisan force. So-called donkey units of partisans were assembled around a hastily trained indigenous cadre and used as a raiding force against the mainland. The islands from which they operated were strategically located behind enemy lines and were protected from enemy attack by the UN naval blockade and ROK garrisons. Because the partisans required only a few American personnel as advisers, they represented an effective, inexpensive force multiplier for the Eighth Army.[34]

But when the final cease-fire was concluded in June 1953, the last radio message to reach the Liaison Division from Green Dragon was a curse.

key units on the Korean west coast had been grouped into two regiments named Leopard and Wolfpack. In addition, a company assigned the designation Kirkland had been organized on Yodo Island off the east coast of Korea. At this point, the increased activity and visibility of the partisans began to provoke a violent North Korean reaction. Some of the more vulnerable islands on the west coast came under enemy attack. This posed a threat to the partisans and to the SALAMANDER HUMINT operations of the Liaison Detachment. The end result was that the guerrillas had come under Liaison Detachment control.[35]

During the course of 1952, the Liaison Detachment expanded the initially small Kirkland force on Yodo to regimental strength. The Leopard and Wolfpack organizations on the west coast were also built up. Operating from their island safehavens and assisted by a sprinkling of American advisers and US logistic support, the partisans waged a lively little war of their own. That year, the partisans optimistically claimed to have inflicted 51,000 casualties on enemy forces. Partisan casualties, however, were not light: the partisans had to defend their own island bases in addition to mounting offen-

changed hands two or three times. More than 2,000 partisans became casualties in 1952, and more than half of these were killed or listed as missing in action.[36]

PAIR

The Army viewed this kind of amphibious warfare as a success. In the Korean War's wider context, however, the partisans were more of a nuisance to the enemy than a real threat. They were never able to establish any bases on the mainland or conduct operations larger than raids. Moreover, landing operations were hampered by the harsh Korean winters and, on the west coast, by the enormous tidal fluctuations that regularly turned beaches into vast and impassable mudflats.

Meanwhile, even more ambitious schemes were under way. In April 1952, FECOM produced a Guerrilla Operations Outline, 1952. This proposed adding an airborne dimension to the existing partisan amphibious operations. FECOM decreed that "all commands will qualify paratroops." Accordingly, paratroop trainees were taken from the existing Leopard, Wolfpack, and Kirkland formations and grouped in a unit that officially became the 1st Partisan Airborne Infantry Regiment (PAIR) in November 1952. At the same time, the Leopard, Wolfpack, and Kirkland units were redesignated respectively as the 1st, 2d, and 3d Partisan Infantry Regiments.[37]

The first contingent of the 1st PAIR's new airborne troops was committed to action in early 1953. On the night of 23 January, a flight of three Air Force C-119s guided by a B-26 Pathfinder aircraft airdropped a special 97-man "Green Dragon" unit behind enemy lines to set up an operational base for guerrilla activities. The fate of this first (and, as it turned out, only) major employment of partisans in an airborne role was not a happy one. After a long delay, the party made radio contact with headquarters and reported taking heavy casualties. Reinforcements and supplies were promptly flown in to sustain the Green Dragon force. But when the final cease-fire was concluded in June 1953, the last radio message to reach the Liaison Division from Green Dragon was a curse. The operation had been compromised and was under enemy control.[38]

The whole episode became just another part of the generally melancholy story of airborne special operations during the Korean War. The 8240th Army Unit and its Air Force counterpart repeatedly launched behind-the-lines sabotage missions. Hundreds of Koreans floated down on night drops into the black hole of

North Korea and were never heard from again. In 1952, the 8240th had paradropped "Mustang Ranger" teams of partisans behind enemy lines on half-a-dozen occasions to attack enemy railroad lines. The teams varied in size from five to 20 men. They all met the same fate. After the "Green Dragon" operation had commenced, additional large sabotage teams drawn from the ranks of the 1st PAIR were sent in. None survived.[39]

In 1951 and 1952, the Far East Air Force had dropped some 200 sabotage agents of its own on 19 separate missions directed against North Korean facilities. The agents accomplished practically nothing, and only one party ever returned safely to UN lines. Despite these unpromising precedents, the Liaison Detachment's Guerrilla Division had laid plans in the spring of 1953 to use the 1st PAIR's "Southwind" element in yet another attempt at mounting sabotage operations. It proposed to parachute in 48 two-man teams to blow up North Korean railroads. Perhaps fortunately for all concerned, the mission was never implemented.[40]

The failure of the Green Dragon operation did not become apparent until the fighting had ended. Thus, during the first part of 1953, the Liaison Detachment was encouraged to lay down plans for an ambitious and greatly expanded program of guerrilla warfare. In addition to building up the 1st PAIR, the Detachment expanded two of its original regiments to provide additional forces for seaborne raids and assaults. The overstrength 1st Partisan Infantry Regiment was split up, allowing the formation of a new 6th Partisan Infantry Regiment. In similar fashion, the 2d Partisan Infantry Regiment contributed personnel to form a new 5th Partisan Infantry Regiment. The regiment based on the Korean east coast, the 3d Partisan Infantry, was too small to break up in this way, but its members were given airborne training. (There was no 4th Partisan Infantry Regiment, because Koreans allegedly associated the number four with bad luck.) [41]

The KLO and its successor organizations, the 442d CIC Detachment and the Far East Command Liaison Detachment, Korea, occupy a unique place in the history of Army intelligence.

A Small Army

As a result of these preparations, the Liaison Detachment had fielded what amounted to its own Korean Army by the time of the July 1953 ceasefire. The six-regiment force had a strength of more than 17,000 troops. The small American cadre assigned to the partisans included 55 personnel from the Army's newly organized 10th Special Forces Group.

This guerrilla army possessed 300 trucks and trailers; was equipped with its own freighters, crash boats, and fishing vessels; and consumed 7,500 tons of supplies a month. Rice accounted for the bulk of the supply allotment; each partisan was issued 100 pounds a month, some for personal consumption, the rest for barter. The partisans also had their own chaplains, band, and travelling entertainment troupe. The Liaison Detachment even published a house magazine for them, *The Parachute.*[42]

All this was something of a triumph for American-style organization. There were, however, some liabilities. Understandably, there was a certain rivalry between the American-controlled partisans and the regular ROK forces. Also, the partisan operation had swollen to such a size that some now questioned its effectiveness. While partisan raiders had served as a useful adjunct to UN forces, their value when used in large conventional units was open to dispute, especially because of the nature of their training and equipment.

The question was never fully resolved. A ceasefire occurred before the new partisan structure could be committed to battle, the guerrillas were forced to evacuate their island bases, which lay north of the Demilitarized Zone now demarcating

North and South Korea, and most of the partisan units were disbanded.[a 43]

Psywar Activity

In 1953, the Detachment also expanded its responsibilities to include psychological warfare, or "psywar." This might seem to be an odd area of involvement for what began as an intelligence organization, but there were precedents. The OSS had conducted psychological warfare operations in World War II, and Army doctrine closely linked covert operations and psychological warfare. By mid-1953, the Liaison Detachment was providing classroom training to Koreans in psychological warfare and preparing propaganda leaflets for distribution in the enemy rear. In addition, it was using propaganda to sustain the morale of its own partisans.[44]

Evaluation

The KLO and its successor organizations, the 442d CIC Detachment and the Far East Command Liaison Detachment, Korea, occupy a unique place in the history of Army intelligence. The KLO started out as a small residual FECOM intelligence presence in Korea, increased in scope as a result of the North Korean invasion, and then was redesignated and further expanded during the darkest days of the war. Ultimately, it was redesignated once more and given responsibility for the whole Army covert and clandestine effort in Korea. Its particular pattern of organization, however, would not provide an operational model for Army intelligence in the future. The Liaison Detachment's structure was revamped almost as soon as the fighting in Korea ended.

Essentially, the Liaison Detachment was a creature of the Korean war. Its efforts produced a certain long-term impact: the Army was made aware of the potentialities for conducting positive human intelligence collection in peace as well as war. Moreover, certain Special Forces operations in Vietnam would later parallel, but not replicate, Liaison Detachment activities in Korea. Generally, however, the organization's accomplishments and the lessons learned from them went down a historical memory hole and passed into oblivion along with other aspects of America's "forgotten war" in Korea.[45]

❖ ❖ ❖

[a] Evanhoe felt that exacerbating this rivalry was the "large influx of South Korean citizens into partisan ranks whose only reason for volunteering was to escape being drafted into the South Korean Army," as well as the fact that "Many of those recruited were pimps, thieves, and other undesirables who were hiding from South Korean authorities and wanted to use duty with the partisans to escape."

Grappling with Covert Action after the Cold War

Clinton's Secret Wars: The Evolution of a Commander in Chief, *by* Richard Sale. (New York: St. Martin's Press, 2009), 491 pp., index.

Matthew P.

Former President Bill Clinton's foreign policy reputation has suffered from charges that he was disengaged, ambivalent, and hesitant to use military force. In *Clinton's Secret Wars: The Evolution of a Commander in Chief*, journalist Richard Sale attempts to refute those charges by arguing that nonpublic initiatives, especially the use of covert action, show that Clinton was more proactive and resolute in dealing with foreign policy crises than his critics have allowed. Though the book does not succeed in making this case—at least in this reader's judgment—Sale does add to public understanding of some of the lesser-known foreign policy options available and how the first president to take office after the Cold War used them.

Sale struggles, sometimes contradicting himself, to show Bill Clinton growing steadily in knowledge and fortitude through his terms of office into a man of action. In describing the period after the infamous October 1993 Black Hawk episode in Somalia, Sale writes, "Something in Clinton had hardened, and he emerged from the crisis a different man."(88) By spring 1994, "Clinton's aggressiveness had blazed like a torch…[and] his advisors caught glimpses of some fresh, inner steel."(114) Yet, Sale continues to depict Clinton as vacillating, exhibiting a caution on Bosnia, for example, that "nearly crippled him." (137) But four pages later, in discussing Clinton's actions in July 1995, Sale alludes to "new inner toughness," (144) and by August, a "new unleashed aggressiveness."(152)

Sale provides no solid evidence for all these supposed increases in toughness. By the beginning of Clinton's second term in January 1997, the United States had failed to stop Serbian leader Slobodan Milosevic's forces from overrunning Srebrenica, and two timid regime change initiatives had failed in Iraq. At that point, Clinton still followed the lead of cautious allies on Iraq. With respect to countering terrorism, the administration had no real plan, even though Sale claims that by the summer of 1998, Clinton "was like a great sea bird, a storm petrel, swooping low over the waves alert for any prey." (302) The record shows otherwise: Clinton exerted little or no pressure on the Taliban or the government of Pakistan. Not until mid-1999 does the book show Clinton in full form, rallying allies to escalate a bombing campaign against Milosevic. But this was hardly a brazen stand, since everyone from France to Human Rights Watch to the Quakers supported military action.[1]

Sale also is given to interpreting evidence selectively in Clinton's favor. For example, when Clinton used third countries to supply arms to Bosnia—a tactic that avoided a covert action finding and its attendant congressional oversight—the move can be seen as laudably resourceful if one is sympathetic to the subject or as subversively abusive of power if not. During the 1995 Dayton negotiations, the Clinton administration agreed to keep Milosevic in power to retain a negotiating partner who could speak for the Serbs. Sale finds this bold:

[1] On the various human rights groups supporting military action, see Samantha Power, *"A Problem from Hell": America and the Age of Genocide* (New York: Basic Books, 2002), 434–35. Power's book, especially the pages that address the Clinton presidency (pages 293–502) generally support the conventional wisdom concerning Clinton's handling of foreign policy.

All statements of fact, opinion, or analysis expressed in this article are those of the author. Nothing in the article should be construed as asserting or implying US government endorsement of an article's factual statements and interpretations.

"To keep the peace process alive, Clinton would use Milosevic, squeeze him like a rind, then toss him away." (158) A more critical perspective might have been that the compromise laid at Clinton's feet the entire record of Milosevic's human rights atrocities from then on.

The discussion of renditions of terrorists to third countries during that period also reflects a favorable bias. Even though Clinton's White House counsel warned that such renditions violated international law, Sale depicts them as brave, in contrast to the criticism of renditions often made of the subsequent administration. Similarly, Sale blames most of Clinton's first-term foreign policy trials on his predecessor, George H.W. Bush, but he gives no indication that Clinton similarly burdened his successor by not curbing Iran's influence in the region or by delaying action against al-Qa'ida. If any single sentence in the book highlights Sale's tendency to see toughness where it might not be, it is the following quote from Clinton: "If anybody f—s with us, we'll respond. And we're going to get the UN to finally show up and take over." (88)

Whether the book salvages Clinton's foreign policy reputation or not, it does a service by exploring the important subject of covert action in the post–Cold War era. The original 1947 mandate for covert action—a US foreign policy activity in which Washington's hand remains hidden—specified that it was to be used for countering communism. Until 1991, the goal of most covert actions—even if they were not in response to a direct communist threat—was to counter communist influence or Soviet-backed governments. The fact that the United States continued a robust covert action agenda against a complex matrix of threats after the demise of the Soviet Union makes for a fascinating field of inquiry. As Sale suggests, the process by which the US government decides to undertake a covert action program is interesting in and of itself, drawing input from sometimes competing and sometimes cooperating (although not always amicably) elements of the government, including various members of the Intelligence Community.

The relationship between intelligence and policy in the covert action context deserves study, and at times in this book Sale hints at exploring it more fully. "It is a common myth that intelligence helps shape policy," Sale writes, "but the opposite is true. Policy, or the lack of it, usually shapes and fashions intelligence."(43) Sale's book also shows CIA in a role that this reviewer believes is its most underappreciated, that of serving as a shadow State Department, clandestinely engaging with foreign governments and security services on a range of unacknowledged projects and serving as a back channel to foreign leaders. This function, even if not explored in great detail, appears in the background in much of the book.

Overall *Clinton's Secret Wars* would have been better if Sale had not tried to right a perceived wrong in prior assessments of Clinton's foreign policy and had instead taken a more straightforward look at the use of covert action in the post–Cold War environment. This could have been done with only minor tweaks, namely, excising the effusive language about the president's ever-intensifying focus and his perpetually rejuvenating inner steel, observations that repeatedly detract from the more interesting material on creative foreign policy options available to him. Though his successors used these policy alternatives against similar targets, it was Clinton and his team that refined and debated them for the first time after the Cold War. By taking the reader on a tour through eight years of an administration grappling with such questions in a changed world, Sale has made a significant contribution other than the one he seems most to have intended.

Takes on Intelligence and the Vietnam War

Vietnam: The History of an Unwinnable War, 1945–1975, by John Prados. (Lawrence: University Press of Kansas, 2009), 665 pp.

Why Vietnam Matters: An Eyewitness Account of Lessons Not Learned, by Rufus Phillips. (Annapolis, MD: Naval Institute Press, 2008), 398 pp.

This Time We Win: Revisiting the Tet Offensive, by James S. Robbins. (New York: Encounter Books, 2010), 364 pp.

Reviewed by Clayton Laurie

On hearing different and opposing assessments regarding US progress in Vietnam by two members of the same fact-finding team in the fall of 1963, President John F. Kennedy quipped, "The two of you did visit the same country, didn't you?" Readers of these three books seeking a better understanding of the CIA's role in Southeast Asia and the lessons of that conflict for today may well ask a similar question. Nearly 40 years after the end of the US involvement, after the publication of a score of histories describing CIA activities during that time, and after the declassification of thousands of documents, opinions regarding Agency failures and accomplishments remain far apart, as do the authors' interpretations of how the experiences of Vietnam apply to the conflicts of today.

Independent historian and self-described "engaged leftist intellectual" John Prados needs little introduction to scholars of intelligence history or of the Vietnam War, as he has written some 17 books on these subjects.[1] His latest work, published by the University Press of Kansas, will undoubtedly have a wide readership and garner acclaim from those who share his interpretations of the war and of the CIA. A large study, with a comprehensive bibliographic essay citing a wide range of archival and published sources, *Vietnam: The History of an Unwinnable War* is a recipient of the Henry Adams Prize from the Society for Historians in the Federal Government and has received numerous accolades from academic reviewers. The history, intended as a broad overview of the conflict, deals extensively with high politics and the antiwar movement, but it also frequently refers to the CIA's role at home and abroad.

Prados tends to view the CIA as an organization whose activities in Southeast Asia and at home generally contributed more to the problems of the day than to their solutions. Such critical assessments emerge throughout this work when the CIA is mentioned, starting with the Saigon Military Mission (SMM) in 1954 and extending through passing treatments of covert operations, the order-of-battle controversy, Agency activities in Laos, the Phoenix program and rural pacification, and involvement with South Vietnamese leaders. From this work, however, a reader new to CIA history would get the erroneous impression that the Agency engaged in all manner of nefarious activities in Vietnam, failed in most every Southeast Asia-related mission, and spent the

[1] Prados is affiliated with the George Washington University's National Security Archive, and he frequently blogs about the CIA on the archive website, www.gwu.edu/~nsarchiv/.

All statements of fact, opinion, or analysis expressed in this article are those of the author. Nothing in this article should be construed as asserting or implying US government endorsement of its factual statements and interpretations.

better part of its resources on illegal surveillance and collection activities against those involved in the antiwar movement at home—the latter a rare and relatively brief deviation from the Agency's traditional foreign intelligence mission, which did score numerous Cold War successes in Southeast Asia and elsewhere.

Prados has chosen to give little or no attention to publicly available CIA-commissioned histories of the period, and unfortunately his book went to press before the release in 2009 of several in-depth, formerly classified, CIA-sponsored histories written by Thomas L. Ahern, and before the release of documents on the Agency's proprietary airline, Air America.[2] Other available works, such as the National Intelligence Council's published collection of estimates produced during the Vietnam War, Ahern's published history on the CIA and rural pacification, and Harold Ford's *CIA and the Vietnam Policymakers* are cited but not extensively used in this volume.[3]

Unused and uncited are a number of well-documented and rich treatments of Agency programs that give fuller and more positive perspectives—although not without criticism—on its efforts during the period, and at the same time more accurately reflect the environment in which the Agency operated at home and abroad. For example, MHCHAOS, mentioned in passing by Prados, gets full treatment in *Richard Helms as Director of Central Intelligence*, declassified in 2006.[4] *Studies in Intelligence* also has published many now-declassified articles dealing with Southeast Asia, especially technical collection and reconnaissance programs. Other pertinent publications, such as the CIA chief historian David Robarge's monograph on the A-12 Archangel supersonic aircraft would have provided more on that technological feat.[5] Sadly, the portrayal of the CIA in Prados's work tends to reflect the antiwar, anti-Establishment view so often heard since the 1970s, when the Agency first faced lurid and media-sensationalized allegations of wrongdoing and intense congressional hearings.

In recent years, a new generation of Vietnam War scholars, many born after the conflict and whose perspectives come from scholarly research rather than direct participation in the war's events at home or in Southeast Asia, have challenged many accepted interpretations touched on in Prados's work, such as his discussion of the Phoenix program, and suggest that revisions in his thinking might be in order. But Prados dismisses those other scholars and the debate they have initiated. He writes, "this is not revisionism, it is neo-orthodoxy." (328) One would conclude from such statements that the author made up his mind about US and CIA involvement in Southeast Asia long ago and that no amount of new material will change his views. As he writes, "Ultimately I side with those who consider Vietnam an unwinnable war. I came to that view early, but extensive research and deep analysis confirm that impression." (xv) For the intelligence officer, *Vietnam: The History of an Unwinnable War* does more to reveal the author's perception of the CIA than its role in the war. For the latter, Agency-released histories provide the fullest picture.

Why Vietnam Matters: An Eyewitness Account of Lessons Not Learned, by Rufus Phillips, certainly ranks as an account that all intelligence officers should read and consider.

Phillips's detailed memoir, which describes his service with the CIA and USAID in Vietnam and Laos between 1954 and 1968, draws on archival research, interviews, official volumes from the Department of State and CIA—including Ahern's pacification volume—plus many other pertinent scholarly publications to form a very readable account. The book makes use of many of the same sources as Prados's work, but it differs greatly in tone and in its views of the CIA's efforts, although it is still critical at times. The discursive endnotes and biographical sketches bring the reader up to date on the people who played key roles many decades ago, and an extensive bibliographical essay suggests further reading.

A US Army officer on detached service with the CIA, Phillips arrived in Southeast Asia as a member of the Agency's small SMM in July 1954. Established after a request by President Dwight Eisenhower to DCI Allen Dulles to advise and stabilize the Emperor Bao Dai's government under Prime Minister Ngo Dinh Diem, the SMM undertook what must have seemed a Herculean task. The legendary Edward G. Lansdale, a US Air Force officer assigned to the CIA and fresh from the successful repression of the Huk rebellion in the Philippines, directed the effort. In the fall of 1954, he set out to do in South Vietnam what he had done in the Philippines—stabilize, boost, and strengthen the government, while removing communist-inspired threats to the new regime.

Phillips points out early on, and frequently reiterates, that Lansdale and those small numbers concerned with the "other war" (defined as rural development and winning the support of the largely peasant southern population) worked outside the US diplomatic, military, economic, and intelligence bureaucracy in cooperation with their South Vietnamese counterparts in a relationship based on common knowledge, mutual respect, and shared goals. The SMM assisted these local efforts and never sought to dominate what was a job the Vietnamese had to do for themselves—as President Kennedy would say in an interview with correspondent Walter Cronkite in the fall of 1963. SMM personnel, in Phillips's view, from Lansdale on down, were sincere and selfless American patriots who possessed great knowledge of Asian cultures and history, superlative interpersonal skills, and a clear ability to work with, and not around, the South Vietnamese in a common fight against communism.

Perhaps most important, Phillips, like Lansdale—and unlike most American military and political leaders—recognized that the war against Ho Chi Minh represented first and foremost a political and ideological war and not a contest of arms. Victory or defeat hinged on gaining or losing adherents to the cause in both Southeast Asia and the United States. Bullets, bombs, and troops could not triumph alone, in any amount or over any length of time. Only by providing peasants with rural security, lifting them from poverty, and educating them on the merits of democracy and the evils of communism, could South Vietnam survive and the US obtain its goals. While Lansdale worked with the new regime on higher-level state stabilization matters in Saigon, Phillips worked with the peasants in the Mekong Delta, central coast, and central highlands. Phillips found the peasants amenable and loyal to Diem's government once rural development projects began and the peasants realized alternatives to the communists existed—the only other presence in the countryside prior to 1954 was the despised French. The Army of the Republic of Vietnam (ARVN), in Phillips's view, also exerted a positive influence once its units moved into the villages. Contrary to most traditional accounts, Phillips notes that the people came over to support the government, ARVN troops integrated well into the villages, and peace and stability came to the countryside.

It is here though that Phillips saw the first indications of things going seriously wrong. The SMM closed in November 1956, its mission accomplished. US efforts then went big, years before US efforts went even bigger during 1964–65. As Phillips writes, bureaucracy took over. The CIA established a station as part of a larger, ever growing State Department Country Team. The US Military Assistance and Advisory Group (MAAG)—like its 1962 successor, the Military Assistance Command-Vietnam—removed the ARVN from the villages and reconstructed the force as a conven-

tional Western-style army to counter an expected North Vietnamese invasion. The ultimate US–South Vietnamese defeat, Phillips claims, really occurred then, although he still held out hope as late as 1972 that the overall situation could be saved. Yet the cooperative connection to the South Vietnamese, both within their government and among the peasantry, was lost, never to return.

Following this early service, Phillips worked in similar programs for the CIA in Laos before returning to Agency Headquarters in Washington. Fed up with bureaucracy, especially after experiencing the independence of field work, he resigned from the Agency. When he returned to Vietnam with USAID in the early 1960s and became involved in the Strategic Hamlet Program, he noted with growing alarm the strained and distant relationship between most Americans assigned to rural areas and the South Vietnamese. Efforts to shift focus back to the classic counterinsurgency, to reintroduce Lansdale, and to influence President Kennedy's policies all failed, even though Phillips made direct appeals to Kennedy in the fall of 1963. These White House meetings were contentious, as military and civilian advisers, including Secretary of Defense Robert S. McNamara, took issue with Phillips's assessments and showed early signs of favoring a US military commitment.

Although Phillips stayed involved for several more years, the Americanization of the war after 1965 pushed rural development into the background with dire results. Phillips writes favorably of the Civil Operations and Revolutionary Development Support (CORDS) program, which began in 1967 and increased in intensity after the communist Tet offensive of 1968. To him, CORDS represented the embodiment of what he had worked towards since the mid-1950s. With rural pacification and security, nation building, and anti-Viet Cong activities all under one program, progress came swiftly. "By 1972," Phillips writes, "most of South Vietnam, particularly in the Delta area, was not only pacified but peaceful. So was most of central Vietnam." Phillips continues, "the North Vietnamese would later admit they suffered a severe reversal in the South Vietnamese countryside in the years after 1968, acknowledging that many of their bases had been wiped out in South Vietnam and that numbers of North Vietnamese and Viet Cong troops had been compelled to retreat to sanctuaries in Cambodia." (301) These firsthand observations confirm much of what newer Vietnam scholarship now shows, although improvements came too little and too late to affect the outcome of a war the American public had abandoned.

As a thoughtful participant in the events described, Phillips offers some practical lessons for those involved in today's counterinsurgencies. Foremost, Phillips stresses that Americans must know who they are as a people, and leaders must know (and be realistic) about what they are trying to attain abroad. US leaders must also know their allies and adversaries.

More important, however, Phillips maintains that if our nation is to be involved in such conflicts, we must know the "x factor"—the political and psychological nature of the struggle for hearts and minds—and the feelings of the people for whom we are fighting. We need to communicate with them on a human level, understand what motivates them, and view the conflict through their history, society, and culture. We need to know our enemies, their capabilities and motivations, as well as the level of their willingness to continue their resistance and up to what level of cost. Decisionmakers must be able to explain and connect policies and events abroad to the American public. Finally, Phillips repeatedly emphasizes that we must know whether we are fighting a conventional war or a political/ideological war—or a combination of both—so that we can bring the most suitable weapons to bear. These would include, of course, knowledgeable intelligence officers and military personnel willing to work long, hard years at the grassroots level.

James S. Robbins's *This Time We Win: Revisiting the Tet Offensive* clearly fits into the revisionist school of Vietnam War history that Prados dismisses. *This Time We Win* is not a history of the CIA in Southeast Asia, although the "Intelligence Failure" chapter accurately

speaks of the Agency, its analysis of the war in 1967, and the warning it provided before the 1968 Tet offensive. Robbins positively portrays CIA activities in a way not usually seen in most published histories.

The main value of this book for intelligence officers lies in its descriptions of how public perceptions—for better or worse—affect a nation's foreign policy and the course of its military conflicts. Focusing on public, political, and media perceptions of the Tet Offensive during its initial phase in January and February 1968, Robbins claims that most Americans saw the event negatively and today remember Tet for all the wrong reasons. The perception of loss, he argues, became a self-fulfilling prophecy, even though history shows that what happened in the offensive was a military defeat for the North. In short, the US lost in Vietnam not because of any military defeats but because US leaders, in effect, chose to lose and repeatedly avoided opportunities for victory.

Historians have long accepted that the communists suffered a major military defeat during the short but ferocious Tet offensive in 1968. At the same time, historians accept that the communists scored a major political and psychological victory as American public opinion turned against the war their leaders had consistently said they were winning. Using a wide variety of government records, published histories, interviews, and television and print news accounts, Robbins shows that Tet may have shocked the public, but it came as no surprise to US intelligence officials, soldiers, or politicians in the Johnson administration. All had anticipated a last-ditch offensive in South Vietnam months in advance, prepared for it militarily, and rapidly defeated it once it occurred, inflicting a clear military defeat on the communists, who failed to achieve any of their goals.

Robbins goes on to describe a US administration that essentially snatched defeat from the jaws of victory. President Johnson failed to explain what had happened; what the administration knew and what it had been doing beforehand; and how Tet affected or did not affect long-term US goals. This lackluster response, reinforced by media reports focusing on the spectacular, gave Tet the appearance of a major setback and served as proof that US policies had failed. The idea that Tet constituted an American catastrophe settled in the public's mind and never went away. Robbins concludes that "Tet was less a case of intelligence failure than a public relations fiasco." (123)

This all matters today, Robbins maintains, "because the Vietnam War is remembered by a large segment of the political class as pointless, immoral, and illegitimate, [and the] mere mention of Vietnam tends to delegitimize any conflict to which it is compared." (9) Because Vietnam has been so widely seen as an unwinnable war, comparisons of that conflict to the current battles in Afghanistan and Iraq are not intended to lend clarity, "but rather to couch the discussion in terms of inevitable defeat." (9)

Robbins warns that US adversaries today have drawn inspiration from the Tet offensive and hope to score similar victories. They see "America's national will as an Achilles heel" that negates its policies and power. Tet proved that a small, weak force could defeat the most powerful nation in human history by creating a big splash and the perception of power where none existed. This provided an immediate political victory that set up the North's future military triumph. Robbins concludes that the United States could just as easily lose today's conflicts if its people convince themselves that they cannot succeed.

All three books are excellent for their treatment of the history of the Vietnam War and the CIA's role in the conflict. They are less effective in their pointed analogies and comparisons of that war to the current conflicts in Afghanistan and Iraq. History is rarely so neat as to provide direct and applicable comparisons—as if times, actors, policies, and circumstances do not change. In the authors' attempts to connect what happened in Vietnam to what is happening now, one is led to wonder if writing history was their goal or if they merely intended to harness history to reinforce, or undermine, present-day policies and political agendas.

General

Challenges in Intelligence Analysis: Lessons from 1300 BCE to the Present, by Timothy Walton. (New York: Cambridge University Press, 2010), 294 pp., bibliography, maps, index.

Former CIA analyst Timothy Walton begins his book with a discussion of the basic elements and tools of intelligence analysis, which in the end supports decision making. For example, after identifying various factors an analyst must be careful to consider—uncertainty, deception, surprise, estimates of the accuracy of judgments—he describes some of the important techniques that can be applied. These include the time-line or chronology, competitive hypotheses, and various matrix models. Finally, he stresses the value of presenting the decision maker with options when no single result is directly on point.

To illustrate how analysis has functioned in the past, he provides 40 historical "lessons" from biblical times to the present. While the reader might legitimately expect the lessons to demonstrate the techniques Walton presented in the introductory chapters, that is not what the lessons do. Instead, they are historical summaries that set the stage for analyses. For example, his account of Moses sending spies into Canaan only summarizes the conflicting reports he received and the resultant disagreement among the leaders. There is nothing about fact checking or other analyses that might have led to conclusions they might have reached. Likewise, in his discussion of Hitler's surprise attack on the Soviet Union, Walton mentions Stalin's requirements for intelligence and the indicators that an attack was imminent, but he does not analyze why Stalin steadfastly refused to believe them. In the case of the run-up to the attack on Pearl Harbor, Walton provides a good summary of what happened and then acknowledges it as "the most famous and consequential example of failure in intelligence analysis." (95) But he fails to describe the analyses performed by those involved that allowed for the surprise.

A similar approach applies in the case of the atomic bomb spies. He tells how the FBI learned of the espionage through defectors and the Venona messages, but he neglects to comment on how the Bureau approached the difficult analytical problems the decrypts posed. The case also points to a major weakness of the book. None of the facts presented are sourced, and this leads to careless errors. Thus Walton writes: "shortly before Gouzenko's defection [5 September 1945] Elizabeth Bentley had volunteered information to the FBI field office in New Haven." (116) In fact, Bentley went to the Bureau office in New York on 7 November 1945. In another instance, Walton claims that Gouzenko mentioned Harry Gold, Klaus Fuchs's courier, but he did not. And Gold was not, as the book claims, the one who identified Fuchs; it was the other way around.[6]

In sum, while *Challenges in Intelligence Analysis* illustrates historical cases in which analysis was no doubt performed, the details of that analysis—how it was done, what one really needs to know—are omitted. The reader is left to resolve that.

Extreme Risk Management: Revolutionary Approaches to Evaluating and Measuring Risk, by Christina Ray. (New York: McGraw Hill, 2010), 287 pp., endnotes, charts, index.

Just days after 9/11, financial analyst Christina Ray read press allegations that Osama bin Laden collaborators with knowledge of the upcoming attacks had been trading in the market in anticipation of the impact of the attack. She hypothesized that if the story were true, analy-

[6] See Amy Knight, *How The Cold War Began: The Igor Gouzenko Affair and the Hunt For Soviet Spies* (New York: Carroll & Graf, 2005); Allen Hornblum, *The Invisible Harry Gold: The Man Who Gave the Soviets the Atom Bomb*, (New Haven, CT: Yale University Press, 2010).

sis of open source stock market transaction data would expose those involved. *Extreme Risk Management* does not reveal whether she tested her theory. Instead, it focuses on her subsequent work, which expanded the concept and explored the similarities she found in risk management techniques employed by the financial and intelligence communities. She argues that "the ability to reverse-engineer actionable market intelligence, or MARKINT," (vii) might be useful as an investigative tool in counterterrorism work and describes a number of risk management models aimed at achieving that goal. In fact, Ray points out that "the CIA is now publicly advertising" for experienced financial analysts. (viii)

Extreme Risk Management is not a book for beginners. Most of its chapters are devoted to complex financial models and the risks associated with their use. But in chapter nine, "An Alternative Path to Actionable Intelligence," she compares risk methodologies employed by financial and intelligence analysts. Here she argues that financial models, which are mainly statistical, can be adapted to show, for example, how the "intelligence community might benefit from information derived from open-source market prices converted to knowledge using quantitative sense-making models…as a metric of sovereign state instability." (151)

More generally, Ray concludes "financial warfare is arguably one of the types of unrestricted warfare for which the United States is least prepared and to which it is the most vulnerable." (254) To meet this threat, she suggests applications for MARKINT by intelligence analysts dealing with cyberthreats, counterintelligence, terrorism, insurgency, and rogue state behavior. While the practical testing of such applications remains to be done, *Extreme Risk Management* provides the basic techniques for analysts in this new field of activity.

The Technical Collection of Intelligence, by Robert M. Clark. (Washington, DC: CQ Press, 2009), 322 pp., end of chapter notes, photos, glossary, index.

Independent consultant and patent lawyer Robert Clark is a former industrial executive, Air Force intelligence officer, and CIA analyst with extensive experience in the field of technical intelligence. His previous books discussed intelligence analysis.[7] In his latest work he turns to technical collection, which he defines as the "collection, processing, and exploitation of *nonliteral* information—that is, information in a form not used for human communication" as opposed to that acquired from human agents. (xvi)

The keys to technical collection are signatures—photographic, electromagnetic, chemical, biological, acoustic, and nuclear—collected by various acquisition systems. Clark is careful to distinguish between signatures and the patterns associated with them. For example, the images of the Cuban missile sites acquired by the U-2 in 1962 are signatures. Their significance results from analysis of the patterns observed by analysts.

Chapters cover the space-, air-, sea-, and ground-based collection platforms intelligence organizations employ today. With the help of impressive color illustrations, Clark explains what each platform does and how it works. He includes, for example, several types of radar techniques, passive RF (radio frequency) collection, and digital satellite imagery. Clark also highlights the differences between active and passive systems. The final chapter looks at managing technical collection. He does not get into detailed operating procedures, though he does present a list of key management tools for consideration. One of the most important and difficult tasks Clark discusses is the allocation of collection requirements to meet time-sensitive demands that often exceed the capabilities of available systems.

Technical Collection of Intelligence is a fine, fully-documented, understandable, and comprehensive, though not elementary, introduction to

---

[7] See Robert M. Clark, *Intelligence Analysis: Estimation & Prediction* (Baltimore, MD: American Literary Press, 1996), and *Intelligence Analysis: A Target-Centric Approach* (Washington, DC: CQ Press, 2003).

a complex intelligence activity. It is an important topic not treated in such depth elsewhere.

Historical

Betrayal: Clinton, Castro and the Cuban Five, by Matt Lawrence and Thomas Van Hare. (New York: iUniverse, Inc., 2009), 217 pp., bibliography, no index.

On 24 February 1996, Cuban MiGs shot down two of three unarmed American light aircraft over international waters off the Cuban coast. The four pilots died. The third aircraft escaped and spread the word. The United States government responded with diplomatic gestures. Matt Lawrence and Thomas Van Hare think more should have been done. *Betrayal* explains why.

The authors, like the pilots flying near Cuba that day, were members of Brothers to the Rescue, a volunteer group that flew missions between Cuba and Florida searching for rafters, or *balseros*, trying to flee Castro. When the pilots spotted rafters, they radioed the US Coast Guard so they could be rescued. Between 1994 and the final mission in 2001, Brothers helped save over 17,000 lives, according to Lawrence and Van Hare.

The Castro government said the planes shot down in 1996 were in Cuban airspace, and it produced a "survivor" to prove it. The authors knew no one had survived. They also recognized the "survivor" as a fellow Brothers pilot and concluded he had penetrated the organization for Cuban intelligence.

While the story quickly dropped from public attention, many questions were left answered; for example, exactly where had the shoot-down occurred; had they actually flown into Cuban airspace? (one plane did briefly); why did the Cubans risk US Air Force retaliation; what had the three survivors said about the mission; and had any formal investigations been done by US officials? *Betrayal* offers answers to these and other questions that emerged as the authors pursued their own investigation. In a chapter titled "Cuba's Queen of Spies," the authors assert that the Pentagon did draft military responses for the president, but he chose not to implement them. Even if he had done so, the Cubans would have been prepared, and not only because of their "survivor" agent. Their principal agent in the United States, Ann Belén Montes, had been in the Pentagon group that had drawn up the options for White House consideration.

And there were other Cuban agents involved, according to this book. At least two were part of La Red Avispa (or Wasp) network, one of many such groups in the Cuban refugee community in Florida. (73ff) Five Wasps were eventually arrested, and the authors explain those agents' roles. Perhaps the most controversial conclusion of the authors is that the US government knew the Cubans were going to attack the Brothers' planes that day and for complex political reasons did nothing to warn the pilots or prevent the attacks. (189ff) The authors' evidence is not rock solid, and the reader is left to make an independent judgment.

In discussing their findings, the authors do not neglect the personalities of the Brothers pilots and their families. They present a poignant picture of Cuban refugees working against Castro while his agents work to thwart them.

Lawrence and Van Hare do not provide specific sources for key points in the book, though in the "Key References and Bibliography" section, newspaper articles, books, and persons interviewed are listed for each chapter.

Betrayal is a sad story of a humanitarian effort eventually shut down by Castro and international politics.

Black Ops: The Rise of Special Forces in the C.I.A., the S.A.S., and Mossad, by Tony Geraghty. (New York: Pegasus Books, 2010), 440 pp., endnotes, appendices, photos, index.

Arabic linguist Tony Geraghty served in the British Army, flew Nimrods in the RAF, and was a war correspondent before turning to writing books. His histories of the SAS (Special Air Service), the IRA conflict, and BRIXMIS (The British Commanders-in-Chief Mission to the Soviet Forces in Germany, which provided cover for a military intelligence unit in Cold War Europe) established him as a respected authority. In *Black Ops* he expands his outlook, first to discuss the broad historical origins of Special Forces (SF) activity, and then to focus on their use by the United Kingdom, the United States, and Israel.

To assume, however, that the book's subtitle implies that Geraghty will give equal coverage to each mentioned organization would be a mistake. After a 39-page introduction that nicely summarizes the entire book, five of the seven chapters are devoted to SF in the United States, one to Israel, and the last to the United Kingdom (the SAS and various lesser-known units). Throughout, Geraghty discusses the influence of British SF elements on their US and Israeli counterparts.

The coverage of US SF units begins with the Revolutionary War, but the focus is on their controversial development during WW II, with the OSS battling the War Department and the British Special Operations Executive (SOE). There is detailed coverage of the contentious use of SF in the Vietnam War. Geraghty goes on to describe the origins of the Delta Force and the tragic outcome of its attempted Iranian hostage rescue mission. He suggests the Delta Force finally achieved acceptance in asymmetric warfare in Iraq.

The chapter on British SF describes the often stormy evolution of operations by multiple, competing units—SAS and special military intelligence elements—that battled the IRA, supported the Falklands War, and fought in the Iraqi wars. Much of the controversy was resolved in 2005 with the formation of the UK Special Forces Group (UKSF), which included the SAS, the Special Boat Service (SBS), the 18th Signal Regiment, and various special military units designed to provide quick reaction capability.

The Israeli Chapter covers the origins of "at least thirty" (178) SF units, including the Mossad, the Aman (military intelligence), the Sayeret Matkal (an army reconnaissance and commando unit), and the Sayeret Shaldag (the Special Air-Ground Designating Team, an air force commando unit). (185) Geraghty records their effectiveness in some well known instances—for example, the aftermath of the Olympic games hostage taking, the Entebbe rescue mission, and the Vanunu case. He also asserts that in operations of this sort, the Israelis possess an advantage in that they can presume they will have the support of Jews wherever Israeli forces operate.

Geraghty takes note of the irony that three of the countries discussed in the book—Israel, the United States, and Ireland—engaged in successful resistance to British rule which "depended, initially, on irregular military forces." (177) *Black Ops* shows how SF units have since developed into a major force in the contemporary battle against terrorism. It is well documented and well worth reading.

Double Death: The True Story of Pryce Lewis, the Civil War's Most Daring Spy, by Gavin Mortimer. (New York: Walker & Company, 2010), 285 pp., endnotes, appendices, photos, index.

The late NSA analyst and jazz musician Edwin Fishel was also an authority on Civil War intelligence. Years in the archives convinced him that most Civil War intelligence memoirs qualified as subprime literature, "so heavily fictionalized that even the most believable parts are suspect." The memoirs of Allan Pinkerton, he wrote, epitomized this condition. Pinkerton "paid almost as little respect to factuality as did the authors of complete fictions."[8] Author Gavin

Mortimer agrees with Fishel's assessment of Pinkerton. Although a man of many positive qualities, writes Mortimer, "Allan Pinkerton… told the truth only when it suited him; when it didn't, he lied." (14) *Double Death* gives many examples, but the most important one concerns Pryce Lewis, one of Pinkerton's principal intelligence agents.

The first part of *Double Death* is devoted to Lewis's early life, the circumstances that brought him to America from his home in Wales, his work in America as a traveling book salesman, and his recruitment into the Pinkerton Detective Agency in 1859. When Pinkerton went to Washington to serve General McClellan as an intelligence officer, Lewis became one of his agents. He operated first in the South undercover as a traveling English gentleman.

At the same time, Pinkerton's most valuable agent, Timothy Webster, was acting as a Confederate courier but secretly carrying mail to the North. In 1862 Webster came under suspicion while in Richmond. Before he could escape he fell ill and was confined to bed. When he failed to appear as expected, Pinkerton sent Lewis and another agent, John Scully, to Richmond to see what was wrong. After meeting with Webster, they too were suspected of being agents and were arrested. In his memoir, Pinkerton writes that to save themselves, Lewis and Scully confessed that Webster was a Union agent. Webster was hanged, twice. The first attempt failed when the noose unraveled. Before the second attempt, Webster told his hangman, "I suffer a double death," hence the title of Mortimer's book. Lewis and Sully were repatriated, and their days as spies were over. This is the version of Webster's demise that Fishel recorded in his book.[9]

While researching the life of Lewis, Mortimer discovered two documents unknown to Fishel. One was a pamphlet written in 1906 by William Pinkerton, Allan's son, telling the true story of the testimony that led to Webster's death: "Scully made the confession implicating Webster… Lewis remained staunch, and did not confess." (236) No one knows why Allan Pinkerton lied. Lewis knew of the pamphlet, but so few others did that his reputation remained tainted. The second document was a copy of Lewis's memoir found in an archive in Canada. Letters indicated he had tried unsuccessfully to get it published. In the memoir, Lewis writes that he never betrayed Webster. The memoir also provides details of Lewis's life story, told in Mortimer's book for the first time.

Mortimer makes a weak case for designating Lewis the most daring spy in the Civil War. Webster is a better fit. In the end, what mattered to Lewis was his tarnished reputation. Burdened by his failure to cleanse it and by persistent financial problems, he committed suicide on 6 December 1911 in New York City. *Double Death* sets the record straight in an important Civil War intelligence case. Well written and soundly documented, it is a valuable contribution.

Empire and Espionage: Spies and the Zulu War, by Stephen Wade. (Barnsley, South Yorkshire, UK: Pen & Sword, 2010), 183 pp., endnotes, bibliography, photos, index.

The Anglo-Zulu War began in January 1879, when troops from the British colony of Natal on the East Coast of Africa invaded neighboring Zululand. Africa was not a high priority for Imperial Britain, and its army units there had few experienced officers and men and suffered from inadequate training. The Brits were counting on rigid discipline and superior weaponry to deal with the "primitive peoples' attack mode." (37) The British force of about 13,000 men—5,000 British soldiers and 8,000 Africans—advanced in three columns. Scouting parties were dispatched, but either they failed to gather intelligence about enemy positions and strength, or commanders disregarded their reports. In the event, the center column of 1,600 British and African troops was surprised and annihilated by a Zulu force 20,000 strong—one half of the Zulu

[8] Edwin C. Fishel, *The Secret War for the Union* (New York: Houghton Mifflin, 1996).
[9] Ibid., 149–49.

Army—at Isandlwana. More than 1,300 British soldiers died. Zulu losses were estimated at 2,000 dead and 1,000 injured. Author Stephen Wade examines in detail the reasons for the defeat. He goes on to describe several subsequent battles. He emphasizes the use and misuse of scouts and spies, the personalities involved, the communications employed, and the role of the media in reporting the conflict to London.

The British ultimately did overwhelm the Zulus, and after capturing the Zulu leader accepted their surrender on 1 September 1879. According to Wade, the British army learned much from the war. He describes its impact on the future of military intelligence—although he acknowledges that some of the same mistakes were made again in the Boer War.

Empire and Espionage is the only book on this topic, and it is valuable for that reason alone. But it has a major defect. Throughout, names, events, and locations are mentioned but not otherwise identified. Thus, for example, we encounter Cetshwayo (the Zulu leader), Garnet Wolseley and Chelmsford (both British generals), and Bartle Frere (the governor of South Africa) without ever learning their roles or titles. Isandlwana, though frequently mentioned in the book's opening, is not identified as a major battle until page 36. Wade offers no explanation for this awkward treatment. Thus, a reader without knowledge of the Anglo-Zulu War will find the book bumpy going.

Final Verdict: What Really Happened in the Rosenberg Case, by Walter Schneir with Preface and Afterword by Miriam Schneir. (Brooklyn, NY: Melville House Publishing, 2010), 203 pp., endnotes, photos, index.

In their 1965 book, *Invitation to an Inquest*, Walter and Miriam Schneir argued that key witnesses at the trial of Julius and Ethel Rosenberg lied and that the FBI had fabricated evidence.[10] Thus the Rosenbergs were not Soviet spies. They were innocent. In 1995, when the Venona decrypts proved the Rosenbergs had indeed been Soviet spies, the Schneirs, to their credit, revised their position in an article published in *The Nation*.[11] Julius had been a spy, they admitted, but not Ethel, her help in recruiting her brother David Greenglass notwithstanding. Then in 1999, the Schneirs read *The Haunted Wood*, by Allen Weinstein and Alexander Vassiliev,[12] and concluded it contained material that cast doubt on aspects of the government's case and might vindicate the defendants after all. *Final Verdict* reports the Schneirs' new position: Julius was only marginally involved in atomic espionage, and Ethel not at all.

Walter Schneir died before he could commit his new arguments to paper in narrative form, but his wife completed the task. She provides an eight-page timeline and a 41-page preface with background on her husband's research. In a 16-page afterword, based on material in the 2010 book *Spies*,[13] she writes that her husband's conclusions hold up. The core of *Final Verdict*—four chapters (113 pages)—is attributed to her husband. It presents his analysis of the critical discrepancies he claims to have found, though in the end his conjectures are only supported by imaginative analysis and speculation. One of the few unequivocal statements comes from Schneir himself when he writes, referring to the Rosenbergs, "Of course they lied and lied when they contended they knew nothing about espionage. Ethel knew about it and Julius practiced it." (155) In the end, Schneir's verdict is that the Rosenbergs were prosecuted for a crime they really didn't commit and not for the one they did.

[12] Allen Weinstein and Alexander Vassiliev, *The Haunted Wood* (New York: Random House, 1999). See William Nolte's review in *Studies in Intelligence* 50, No. 2 (June 2006).
[13] John Earl Haynes, Harvey Klehr, and Alexander Vassiliev, *Spies: The Rise and Fall of the KGB in America* (New Haven, CT: Yale University Press, 2010). For Hayden Peake's review, see "The Intelligence Officer's Bookshelf," *Studies in Intelligence* 54, No. 3 (September 2010).

Nothing the Schneirs present changes the substance of the case. The final verdict remains: "guilty!"

The First War of Physics: The Secret History of the Atom Bomb 1939–1949, by Jim Baggott. (New York: Pegasus Books, 2010), 576 pp., endnotes, bibliography, photos, index.

Author Jim Baggott writes in his preface that his book contains "new materials [that] allow a single-volume popular history of the Anglo-American, German, and Soviet [atom bomb] programs to be assembled for the first time." This claim is an exaggeration. The book does portray the roles played and the controversies experienced by all the well-known scientists involved, from Oppenheimer to Teller. And it accurately chronicles the sequence of events that led to the bombings in Japan that ended WW II. With regard to intelligence, it reviews the work of the NKGB agents in the United Kingdom and the United States who gave the Soviets the plans for the US bombs. Baggott also discusses the impact those agents had on postwar relations among Britain, the Soviet Union, and the United States. But all this has been recounted by others. Baggott doesn't identify anything new in his book. The sources are all secondary, and errors made elsewhere are repeated here. For example, MI5 Director General Roger Hollis did not, as claimed, appoint Kim Philby as the principal liaison officer on the Gouzenko case, and Sir William Stephenson was not code-named *Intrepid*. (384)

The First War of Physics is a good summary of an oft-told story, but nothing more.

The Invisible Harry Gold: The Man Who Gave the Soviets the Atom Bomb, by Allen M. Hornblum. (New Haven, CT: Yale University Press, 2010), 446 pp., endnotes, bibliography, photos, index.

Defenders of Julius and Ethel Rosenberg have long argued that if Harry Gold had not confessed to being a Soviet agent, they would never have been exposed. Author John Wexley was one of many who went further by characterizing Gold's trial testimony as "fantasy… unworthy of belief."[14] With scholarly elegance, Allen Hornblum acknowledges the accuracy of the first claim and then gently demolishes Wexley's, noting that such charges followed Gold beyond the grave.

The Invisible Harry Gold is an explanation—not a defense—of Gold's actions. In explaining them, Hornblum invokes the circumstances of the Depression, growing anti-Semitism in Europe, and the struggles of Jewish immigrants in the United States. Heinrich Golodnitsky was born in 1910 near Bern, Switzerland, and became Harry Gold on arrival to the United States as a four-year-old. Hornblum describes Gold's hardscrabble early years in Philadelphia, where he endured bullying at school, worked jobs to help the family survive, and gradually became aware of the menace of fascism at home and in Europe. In 1933, desperate for work, Gold accepted the help of Thomas Black and went to work for him in Jersey City as chief chemist for the Holbrook Manufacturing Company. Black, a staunch communist, saw in Gold a potential convert. He worked hard to convince Gold that the only hope for defeating fascism lay in helping the Soviet Union since it had outlawed anti-Semitism. Though Gold never joined the Communist Party, he agreed to help it obtain industrial secrets from his employer. With that decision, there was no turning back. Gold eventually graduated to work as a courier for some of the NKVD's most important agents in the United States, including Klaus Fuchs, David Greenglass, and, indirectly, Greenglass's brother-in-law, Julius Rosenberg.

[14] John Wexley, *The Judgement of Julius and Ethel Rosenberg* (New York: Cameron & Kahn, 1955), 66, 73, 373, 384.

Hornblum describes Gold's "gradual seduction into industrial espionage" (45) and his often harsh on-the-job training administered by illegals who served the Soviets in the United States. After WW II began, Gold's assignments were redirected onto military targets. The most important agent he serviced was Klaus Fuchs. Although Hornblum writes that Moscow Centre approved Gold as a contact for David and Ruth Greenglass, who were part of another network, (145) John Haynes, Harvey Klehr, and Alexander Vassiliev in their book *Spies* revealed that Gold met with Greenglass as a last-minute substitution for another courier.[15] In any case, had this contact not occurred, the Rosenberg network might have escaped exposure.

The Invisible Harry Gold treats Gold's espionage assignments with the atom spies in considerable detail. According to Hornblum, FBI investigative work identified Gold as Fuchs's courier. This is contrary to a version reported by Robert Lamphere that Fuchs himself identified Gold as his courier from a picture.[16] The end result, however, was Gold's arrest, prompt confession, and his damning testimony at the Rosenbergs' trial.

Hornblum presents a well-documented, convincing picture of Harry Gold as an anti-fascist who only wanted to help an American ally. Caught up in Soviet espionage he had been unable to forsake, he was sentenced to 30 years in jail and served over half that time. The ultimate irony of this story is that while the American communist agents charged with espionage lied about their participation, Harry Gold, the noncommunist, is the only one who told the truth.

The Kremlin's Geordie Spy: The Man They Swapped for Gary Powers, by Vin Arthey. (New York: Dialogue, 2011), 242 pp., endnotes, bibliography, photos, index, 2nd edition revised.

The first edition of this book was published under the title, *Like Father Like Son: A Dynasty of Spies*. It told the life story of KGB illegal Col. Vilyam "Willie" Fisher, aka: "Col. Rudolf Abel, KGB."[17] The new title may puzzle American readers, but it makes immediate sense to a Brit. A *Geordie* is the common nickname for those from the Tyneside region of North East England, the region in which Willie Fisher was born on 18 April 1902, in Newcastle upon Tyne.

Author Vin Arthey explains Fisher's connections to the USSR—his father had been active in revolutionary activities in Russia and in 1901 fled to the UK, where he was involved in clandestine shipping of arms and literature back to Russia. The family returned to the Soviet Union when the younger Fisher was 17. He subsequently served in the Red Army as a radioman. In 1927 he joined the NKVD. His first overseas assignment was to England in 1935. There he worked for Alexander Orlov and Arnold Deutsch of Cambridge Five fame. Dismissed from the service during the Great Purge of 1938, Fisher was recalled in September, when there was a need for trained radio operators. After WW II, he was trained as an illegal and in 1948 was sent to the United States, where the Soviet networks were in disarray thanks to defectors and the Venona decrypts.

Arthey reviews Fisher's many assignments, including the handling of Soviet agents Morris and Leona Cohen and atom spy Theodore "Ted" Hall. Fisher used a number of codenames—the best known was Emil Goldfus—and his cover was as a commercial artist. Things began to go bad with the arrival of his future replacement, Reino Hayhanen, who proved to be an irresponsible drunk. Fisher had him recalled, but on the way home Hayhanen defected to the CIA in Paris and revealed that he knew a KGB illegal in New York. When the FBI arrested Fisher he gave his name as Col. Rudolf Abel, a prearranged signal to the KGB that he was in trouble. (The real Col. Abel was dead.) Fisher was serv-

[15] Haynes, Klehr, and Vassiliev, *Spies*, pp. 102–3.
[16] Robert Lamphere and Tom Shachtman, *The FBI-KGB War: A Special Agent's Story* (New York: Random House, 1986).
[17] Vin Arthey, *Like Father Like Son: A Dynasty of Spies* (London: St. Ermin's Press, 2004). (In the Bookshelf review of the book in *Studies in Intelligence* 49, no. 3 (2005) Fisher's first name was incorrectly rendered as "Willi.")

ing a 30-year sentence when he was traded for U-2 pilot Gary Powers. Fisher returned to limited duty for a while but soon retired. He never revealed what he did in England or the United States. He died on 15 November 1971 at age 59.

While there are no major changes in this edition, a number of corrections have been made and new details added. These include Fisher's date of birth, the name of his imprisoned brother—Ivan not Boris—and spelling errors. There is also some new material on Fisher's trial, the negotiation that led to his return to the Soviet Union, and "the Forbidden City"—the location of the KGB headquarters in Potsdam.

The Kremlin's Geordie Spy is the only biography of Willie Fisher in English that includes details of his KGB career. Arthey examined new materials from Russia, Britain, and the United States to piece together Fisher's extraordinary career. The result is a welcome contribution to the intelligence literature.

Radio Free Europe's "Crusade for Freedom": Rallying Americans Behind Cold War Broadcasting, 1950–1960. Richard H. Cummings (Jefferson, NC: McFarland & Company, Inc., Publishers, 2010), 257 pp., endnotes, appendices, bibliography, photos, index.

The Crusade for Freedom (CFF) was an early Cold War domestic propaganda campaign aimed at arousing the "average American against the Communist threat." (1) Intensely popular at the time, citizens contributed funds, attended rallies, marched in parades, participated in essay contests, and read the *Crusade for Freedom Newsletter*, which described the nature of the threat and advocated means to counter it. A principal component of the public program was Radio Free Europe (RFE), a broadcast service that sent the 'truth about communism' to countries behind the Iron Curtain. What was kept from the public at the time was that both CFF and RFE were covertly sponsored by the CIA. The CIA role was officially revealed in 1976, but *Radio Free Europe's "Crusade for Freedom"* adds details not made public at the time.

Author and former RFE officer Richard Cummings admits that some might consider CFF and its radio operations as a fraud on Americans. But his view is that if they were a fraud at all, they were benign and probably contributed to a Cold War anti-communist consensus. His book is devoted to documenting that position.

Cummings focuses on CFF and RFE from their planning stages in 1949 until CFF was terminated in 1962. RFE continued to function under CIA sponsorship until 1967, when RFE came under independent management, an arrangement that exists to this day. Cummings first describes the program's origin and goes on to review the bureaucratic and financial conflicts that persisted throughout its existence. Finally he looks at the program's clandestine elements.

The book treats the public side of CFF in some detail. This includes discussion of an extensive publicity campaign involving Hollywood celebrities, the news media, and political, industrial, and military figures. Here we read about the support of Eleanor Roosevelt, Bing Crosby, Ronald Reagan, General Eisenhower, President Truman, Walter Cronkite, President Kennedy, and the Boston Symphony Orchestra, to name a few. Defectors from the Soviet bloc were pressed into service. Col. Joseph Swiatlo of the Polish secret service is a case in point. In RFE broadcasts he informed those behind the Iron Curtain how the KGB dominated the security services of the bloc countries. The CIA role in CFF and RFE was exposed by journalist Drew Pearson in March 1953 (95). Fulton Lewis Jr. added critical remarks in 1957, noting "Dulles doesn't want it known." (171) Cummings explains how these events were dealt with and how they led to the demise of CFF in 1962.

Radio Free Europe's "Crusade for Freedom" is well documented and contains a useful chronology of major events. Cummings does not comment on the overall value of CFF, but judging from this history, it is unlikely that anything like it could be attempted successfully today.

Secrets of the Cold War: US Army Europe's Intelligence and Counterintelligence Activities against the Soviets, by Leland C. McCaslin. (Solihull, England: Helion and Company Limited, 2010), 200 pp., glossary photos, no index.

There are no secrets in this book. Most of the 19 chapters contain reminiscences written by the more than 50 contributors listed on pages 12–14. Curiously, "Special Comments by Francis Gary Powers, Jr.," though listed in the contents, are nowhere to be found. Author and retired military intelligence officer Leland McCaslin adds brief introductory comments to most chapters and contributes two himself, one on the annual military intelligence (MI) ball, the other on travel in Cold War Europe.

The topics covered are not without interest. They include the Soviet and Allied military missions that collected intelligence in occupied zones in Germany, the US-Russian hotline, defectors, counterintelligence, the Berlin duty train, and several case studies. The latter are illustrative and contain no specifics—first names only. No sources are provided.

Secrets of the Cold War with its many photographs does deliver a glimpse of military intelligence activities in Europe during the Cold War, but its content does not live up to the promise of its title.

Through Hitler's Back Door: SOE Operations in Hungary, Slovakia, Romania and Bulgaria 1939–1945, by Alan Ogden (Barnsley, South Yorkshire, UK: Pen & Sword, 2010), 284 pp., end of chapter notes, bibliography, photos, index.

The British Special Operations Executive (SOE) was established early in WW II to run sabotage and support resistance groups in German-occupied territory. By 1943 the SOE was also involved in political subversion—regime change—in Hungary, Slovakia, Romania, and Bulgaria, each one a German ally. Teams of the "wonderfully amateurish" (vi) businessmen, bankers, engineers and academics that staffed the SOE were dropped into each country to do the job. All operations failed to accomplish their primary objectives. *Through Hitler's Back Door* explains why.

The book is divided into three parts. The first deals with Hungary and Slovakia, the second with Bulgaria, and the third with Romania. Author Alan Ogden begins each part with a historical summary of the country and then turns to SOE efforts to bring it under Allied control. "From early on, SOE encountered difficulties in setting up subversive networks in Hungary," writes Ogden. (23) The same would prove true in the other countries. The difficulties included political opposition from the British Foreign Office, competition with the Secret Intelligence Service, and a lack of any established partisan networks. Logistical problems—air support, communications, and resupply—and the shifting loyalties of those contacted in the local governments also were problematic. But in the end, the uncompromising role of a Soviet Union on its own subversion mission was the dominant road block.

Ogden describes in considerable detail more than 30 missions, with emphasis on the persistent operational glitches encountered and their often herculean efforts to overcome them. He pays particular attention to the personnel involved—those that didn't survive and the few that did.

Though they fell short of their primary objective, the operations were not entirely in vain. Ogden tells how some tied up German forces that could have been deployed elsewhere and destabilized the planning of the Wehrmacht high command. He also records the considerable number of Allied aircrews the teams helped escape the enemy, often with partisan and OSS assistance.

This book is reasonably well documented, often with primary sources, though in some cases lengthy operational descriptions are not refer-

enced to sources—the efforts of the AUTONOMOUS team are an example. (249–52)

Through Hitler's Back Door concludes "there were few military or political laurels to emerge from Hungary, Romania, or Bulgaria. Scantily resourced and diplomatically constrained by the need to defer to and to consult with the USSR," they succumbed to "the pull of insuperable political forces." The brave efforts of the SOE teams are a tribute to their courage.

Wild Bill Donovan: The Spymaster Who Created the OSS and Modern American Espionage, by Douglas Waller. (New York: Free Press, 2011), 466 pp., endnotes, bibliography, photos, index.

Donovan of OSS was the first of four biographies of 'Wild Bill' Donovan.[18] It claimed to be the full story, and few in the public knew otherwise. The second and third made similar assertions, adding new details about OSS operations and bureaucratic battles.[19] Was there anything new left to say? The existence of a fourth biography suggests an affirmative answer, and author Douglas Waller calmly and carefully documents this position. The principal difference, however, is one of focus. Waller is concerned more with Donovan the man than with OSS operations. The result depicts an ambitious, brave, hard-charging Donovan, who almost by accident created America's first foreign intelligence service. It was only after completing two fact-finding trips to Europe for President Roosevelt that the idea occurred to him. With the encouragement of the British, Waller writes, Donovan convinced the president to establish the Office of the Coordinator of Information (COI), which became the OSS after the United States entered WW II.

The book concentrates on five aspects of Donovan's life. The first concerns his military career, his success as a Wall Street lawyer, and his political ambitions prior to serving Roosevelt. The second deals with the bureaucratic battles he fought and the egos he ruffled as he struggled to establish COI (later, OSS), and then to maintain its existence in the face of vigorous opposition from elements in the War Department and the FBI. Here we learn that the Army never accepted the OSS role and formed its own foreign intelligence service—nicknamed "The Pond"—under the control of Major John 'Frenchy' Grombach, a man Donovan had once fired. Donovan's other biographers do not mention the Grombach episode, which was treated in this journal in 2004.[20] Donovan's battles with Hoover and the FBI are also described in detail. On the operational side, Waller mentions Operation Kangaroo, a collection effort that defied an agreement with Hoover not to operate in Latin America, a topic covered in this book for the first time.

The third aspect of Donovan's life treated in this book, and for the first time, dealt with his many dalliances with women, something Waller did not try to hide. Their impact on Donovan's marriage did not do him credit.

The fourth part of the Donovan story concerns his frustrated attempts to create and head a postwar intelligence service after President Truman abolished the controversial OSS. Here, Hoover again enters the picture, and Waller leaves little doubt that it was Hoover who spread the rumor to the press that such a service would result in a domestic Gestapo, a charge that applied more to Hoover's own ambitions to direct an all-encompassing, postwar intelligence operation. Donovan's hopes were dashed forever when neither Truman nor his successor appointed him to head the new CIA.

[18] Corey Ford, *Donovan of OSS* (Boston: Little, Brown, 1970).
[19] Richard Dunlop interviewed Donovan for his book, *Donovan: America's Master Spy* (Chicago: Rand McNally, 1982). The other was *The Last Hero: Wild Bill Donovan* (New York: Times Books, 1982), by British journalist Anthony Cave Brown, who claimed "access to all Donovan's papers and his wife's diaries."
[20] See Mark Stout, "The Pond: Running Agents for State, War, and the CIA—The Hazards of Private Spy Operations," *Studies in Intelligence* 48, No. 3 (September 2004).

The final phase of Donovan's career that Waller covers is his service as ambassador to Thailand. Although in his late 60s, Donovan was still difficult to control. The concluding chapter ?overs Donovan's debilitating sickness that led to his death in 1959.

Wild Bill Donovan is absorbing reading. It is documented with primary sources, though the format used makes it impossible to tell what fact a particular document supports. In all other respects, it is a major contribution to the intelligence literature.

Memoirs

All Them Cornfields and Ballet in the Evening, by John Miller. (Kingston upon Thames, Surrey, UK: Hodgson Press, 2010), 324 pp., photos, index.

British journalist John Miller selected the title for this memoir from a line in the 1957 film, *I'm All Right Jack*, wherein a "leftish" shop steward played by Peter Sellers proclaims his desire to visit the Soviet workers' paradise with "all them cornfields and ballet in the evening." Beginning in 1960, Miller spent 40 years as a newspaper correspondent in the Soviet Union and Russia. His splendidly humorous reminiscences compare Soviet reality with the shop steward's fantasy.

While any firsthand account of life in the Soviet Union during the Cold War has inherent value, Miller's story is worthy of attention in an intelligence journal because of his encounters with several subjects of intelligence interest—Donald Maclean, Guy Burgess, and Kim Philby. He tracked down an uncooperative Maclean after acquiring a scarce copy of the Soviet phone book and going to his flat, though Miller was denied an interview four times. Burgess, always happy to talk to fellow Brits, gave Miller several interviews, and we learn some new details of Burgess's unhappy life in the Soviet Union. Miller carried a wreath at Burgess's funeral in 1963 and again met Maclean, who was more civil that time. Philby did not attend, but Miller later met him serendipitously in a Moscow restaurant where Philby was dining with his wife Eleanor and Maclean's wife (and Philby's mistress), Melinda. With a curse, Philby told him to "bugger" off, though Miller did acquire of photo of the elusive defector.

Like most correspondents, Miller got to know the MI6 head of station in Moscow at the time, Rory Chisholm, who was handling the British end of the Penkovsky case. Miller met Penkovsky once at a social function and later covered his show trial. Miller gives two accounts of Penkovsky's execution—a shot in the back of the head, and being burned alive in a crematorium furnace. The latter version has been reported before, and although Miller names a firsthand witness, the evidence is hearsay and the Soviet denials must be considered.

A variety of other vignettes include the Soviet reaction to their shooting down of the U-2 flown by Francis Gary Powers in 1960, Miller's encounter with Alexander Solzhenitsyn, and a KGB "honey trap" that caught the British ambassador in an affair with the sister of Captain Eugene Ivanov, a key player in the Profumo affair, which contributed to the resignation of British Prime Minister Harold Macmillan in 1963. Miller recalls frequent "chats" with the KGB without ending up in Lubyanka, even though he reported the joke about Brezhnev's last words: "Comrade Andropov, please stop fiddling with the life support machine."

All Them Cornfields broadens one's understanding of Soviet society, adds colorful details to some well-known Cold War espionage cases, and is an unqualified pleasure to read.

The C.I. Desk: FBI and CIA Counterintelligence As Seen from My Cubicle, by Christopher Lynch. (Indianapolis, IN: Dog Ear Publishing, 2009), 433 pp., index.

After graduating from Michigan State University, Christopher Lynch found a job in an FBI mailroom as a GS-2 clerk. It was all uphill from there. After 10 years with the Bureau he joined the CIA. Twenty years later, he retired as a GS-14 and wrote his memoir. Like all dutiful intelligence officers before him, he submitted the manuscript for clearance, twice: once to the CIA and once to the FBI. In an author's note, Lynch writes that the "successes in which I participated often seemed to get excised from the text.…As a result operations that fizzled out or otherwise went nowhere get an unwanted emphasis." (vii) He is right about that! *The C.I. Desk* reads like the story of a serial misfit whose cockroach persistence gets him through a 30-year career. Though he advanced from the FBI mailroom to become a counterintelligence (CI) analyst at the FBI and the CIA, something dissatisfies him in each job, and he is soon looking for another position. At the FBI he cut his teeth on the Boris Yushin case and learned how to do CI case reviews, a task he apparently performed skillfully. He later worked for two years for Robert Hanssen, with whom he got on well, he writes. His description of Hanssen as a "nice fellow" challenges those offered by other contemporaries who cast him as an eccentric computer nerd with few social skills.

In 1986, Lynch moved to the CIA where the pattern of job-hopping continued. He tells about his 20 years there, describing the CI cases he analyzed in most of the major divisions in the clandestine service. Many of the assignments were initially interesting, others quickly frustrating. His work on the Ames case and his tours in the new Counterintelligence Center are examples of the former. His assignment to the Office of Security is an example of the latter. Either way, after a year, or at the most two, he would declare that his "frustrations in the Branch kept growing" (320–21), or words to that effect, and move on. Lynch spent most of his final years at the CIA reviewing files for declassification and doing CI case reviews in an unspecified office where he "drifted from desk to desk." (424)

Despite his career turbulence, Lynch writes that he loved CI work and the challenges it presented. It is difficult to pin down the message he wants to convey in this book or to explain his candor in conveying it. But he does seem to be emphasizing the importance of doing one's work well. A most unusual contribution to the intelligence literature.

Holding Hands with Heroes, by Jack Kassinger. (Pittsburgh, PA: Dorrance Publishing Co. Inc., 2010), 242 pp., photos, glossary, no index.

It takes unusual qualifications to begin a CIA career as a GS-4 and retire as a supergrade. In *Holding Hands with Heroes* Jack Kassinger tells how he did it: no college degree, service in the Marine Corps, a recommendation from Dave Phillips (a senior CIA officer stationed in Latin America), and an impressive track record as a clandestine service support officer. In one respect, Kassinger's memoir is a typical account of worldwide assignments and service at CIA Headquarters while raising a family—his wife, Cherie, was a career officer too. But it is also atypical in that unlike the memoirs of clandestine service officers such as Phillips and Milton Bearden that tell of espionage cases in which they were involved,[21] Kassinger explains the critical services a support officer provides to espionage and covert action operations. His vivid descriptions of CIA support operations in Somalia and other African nations make the point. In

[21] After retiring, David Atlee Phillips, wrote a memoir of his career, *The Night Watch: 25 Years of Peculiar Service* (New York: Atheneum, 1977); Milton Bearden and James Risen, *The Main Enemy: The CIA in Battle with the Soviet Union* (New York: Random House, 2003)

the early 2000s, Kassinger was assigned to the Central Eurasia Division, and from that vantage point he describes the impact of the Ames case, the efforts to rebuild a new, secure embassy in Moscow, support operations in the Balkans and Albania, and the turmoil that followed the appointment of John Deutch as Director of Central Intelligence.

The book's title refers to the many officers with whom Kassinger served, some of whom will be familiar to those who worked in the CIA after the Vietnam War. In *Holding Hands with Heroes* Kassinger offers himself as an exemplar for those considering a CIA career.

Intelligence Abroad

The New Nobility: The Restoration of Russia's Security State and the Enduring Legacy of the KGB, by Andrei Soldatov and Irina Borogan. (New York: PublicAffairs, 2010), 301 pp., endnotes, index.

In the foreword to this book, British investigative journalist Nick Fielding warns that the Russian intelligence services "have little tolerance for criticism…since 2000 seventeen journalists have been murdered." (vii) That same year Andrei Soldatov and Irina Borogan created Agentura.ru (in Russian and English), "a journalism-based website for monitoring the Russian services." (7) Though they have been careful to base their often critical articles on open sources and have been interrogated more than once by the Federal Security Service (FSB),[22] the principal successor to the KGB, so far they have managed to survive. *The New Nobility* summarizes their work to date, with emphasis on the sudden breakup of the KGB, the struggle for power among the surviving elements, and the ascendancy of the FSB. It was Nikolai Patrushev, the successor to Vladimir Putin as FSB director in 1999, who called the FSB the "new nobility" with the mission of "stability and order." The authors take care to point out that the FSB should not be "mistaken for a revival of the Soviet KGB," though some journalists have made this error. With all its power, the KGB was subordinate to the Communist Party; the FSB is free of party and parliamentary control, reporting only to the president or prime minister. (4–5)

After the chaos of the Yeltsin era, the FSB moved rapidly to consolidate its power. The authors tell how it worked to "ferret out foreign spies," (36) to bring human rights organizations under control, and to deal with the oligarchs (giving them the choice of leaving the country or going to a jail in Siberia). A program to plant informants in "liberal organizations" was also established. New counterintelligence regulations were created that allowed access to private correspondence and communications through wiretapping. Restrictions on surveillance were removed and the right to search all premises was granted. (114ff) As incentive, FSB officers were given special benefits, including new brick dachas on land confiscated from the oligarchs.

There are several chapters on the FSB response to terrorism, the one area in which the organization has not been very successful. It was while the authors were preparing articles critical of Russian counterterrorism operations that they were summoned to the notorious Lefortovo prison; they don't provide any details of the ensuing interrogation. They do assert that FSB assassination teams have been sent abroad to deal with Chechen terrorists. And while they note the stories that claim the FSB poisoned Alexander Litvinenko using polonium-210 in London, they conclude that "there is no information about whether his death was ordered by the Russian leadership" or by mercenaries. (208)

[22] Federalnaya Sluzhba Bezopasnosti.

The final chapters deal with two interesting issues. The first looks at rumors that the FSB would absorb the foreign intelligence missions of the SVR (foreign intelligence service) and the GRU (military intelligence service). That hasn't happened yet, and for the time being Russia has three foreign intelligence services, with the FSB empowered to deal with the former Soviet republics. The second issue concerns the FSB program for cyberwarfare that uses its own cadre of experts and from time to time employs independent hackers.

The New Nobility presents a persuasive, well-documented view of the FSB that only dedicated, risk-taking Russians could provide.

14. ABSTRACT A prior effort, *State of Knowledge Relative to Intelligence Analysis,* was initially motivated by the fact that seemingly little change had resulted from numerous studies of the intelligence community. Starting with Pearl Harbor, the U.S. intelligence community has often faced criticism for failing to predict or warn of future events. Though the criticisms have come from different groups, a certain commonality exists among the proposals for change in the intelligence community. The other noteworthy feature of these proposals is how little their content has changed over time. A thorough analysis of the intelligence literature was accomplished. This analysis provided an answer to the question of whether the existing literature on intelligence analysis contains the requisite knowledge to inform the development and application of both the mechanistic and cognitive activities to support doing intelligence analysis. A dominant finding was how little the practice of intelligence analysis had been informed by the findings in related scientific disciplines. The primary objective of this research effort was to understand the research findings in relevant scientific disciplines and to relate these findings to the practice of intelligence analysis. This research effort was based on the full text of over 5,800 documents consisting of nearly 172,000 pages. Our analysis of the current intelligence literature showed a continuation of previously observed trends. The number of publications dealing with intelligence analysis has decreased since 2007; in 2012 publication was at the level observed in 1996-1997. Also, we observed that the literature places less emphasis on the improvement of the quality of intelligence analysis. During the effort described in this report we conducted research syntheses for the topics of critical thinking, thinking dispositions, epistemological beliefs, practice based training, and various facets of cognition. Based on the findings of these syntheses, we provide recommendations for improvements to quality assurance practices, analyst selection, analyst training, and improving the content of the Framework for Analytic Cognition.

PREFACE

This effort is a follow on to the analysis we reported in the reports AFRL-RH-WP-TR-2011-0049, AFRL-RH-WP-TR-2011-0051, AFRL-RH-WP-TR-2011-0052, and AFRL-RH-WP-TR-2011-0053. Our primary objective was not only to verify the findings of the previous effort but also to emphasize research synthesis of related scientific areas in order to better inform the practices of quality assurance, analyst selection and training. We have met our objectives and have recommendations on those topics. Unfortunately, our effort was terminated early so we were unable to complete all documentation supporting those recommendations.

This report was preceded by two interim reports: Marsh, M. *Advanced Analysis Cognition: Critical Thinking* and Marsh, M. *Advanced Analysis Cognition: Thinking Dispositions.* These reports were submitted to the Air Force Research Laboratory for review. At the time of this final report, both interim reports were still in press.

NOTE FOR THE READER

In order to communicate the quality and content of the documents found and to accurately portray the authors' different perspectives, this document contains many passages extracted from their original publications. These passages may contain references, footnotes, table and figure numbering, formatting, and errors that are part of the original document, not this report. We used the passages as they were, with no additional editing. We suggest that you refer to the References section to obtain the source document if you would like to see the extract in its original context.

1.0 IMPROVING THE COGNITION OF INTELLIGENCE ANALYSIS

1.1 Introduction

Our prior research effort for the Air Force Research Laboratory (AFRL), *State of Knowledge Relative to Intelligence Analysis*[1], was initially motivated by the fact that seemingly little change had resulted from numerous studies of the intelligence community. Starting with Pearl Harbor, the U.S. intelligence community has often faced criticism for failing to predict or warn of future events. As a result, numerous groups and commissions have been established during the past 30 years to study "what went wrong." All of these efforts have resulted in proposals to "fix" the intelligence community and thereby improve the quality of its products. While the proposals have come from different groups, a certain commonality exists among the proposals. The other noteworthy feature of these proposals is how little their content has changed over time.

The fact that the same solutions are proposed time and time again without any obvious implementation gave rise to a variety of questions. For example, do we know the cognitive and personality attributes (e.g., extrovert or introvert) of a "good analyst?" What does an analyst need to know in order to function effectively? What are the mechanistic as well as the cognitive processes associated with the acquisition, processing, and evaluating of data or information? What are the characteristics of the cognitive transformation of data or information into useable knowledge?

To answer these questions, we conducted a thorough analysis of the intelligence literature. Much was learned from this analysis, but the dominant discovery was how little the practice of intelligence analysis had been informed by the research that existed in related scientific disciplines. Mandel alluded to this discovery in a comment from 2009:

> It is telling, Mandel noted, that no one else has come along since Heuer to continue his work of translating cognitive psychology and other areas of behavioral science into tools for analysis. "In cognitive psychology alone there is at least a quarter century of new research since Heuer published *Psychology of Intelligence Analysis* that is waiting to be exploited by the intelligence community."[2]

The objective of this research effort was to understand the research findings in relevant scientific disciplines and to relate these findings to the practice of intelligence analysis. In addition, to accomplish this we also had to maintain our ongoing review and assessment of the current intelligence literature to insure the validity of our past evaluation of the content of such literature.

[1] Hereafter referred to as *State of Knowledge* for ease of discussion.

2.0 APPROACHES AND METHODS

2.1 Information Acquisition and Assessment – Approach

We used the same approach for acquiring information during the *Advanced Analysis Cognition* research projects as we used during the *State of Knowledge* research. We described our approach in the final report for *State of Knowledge*.[3] In addition, as part of the *Advanced Analysis Cognition* effort, we continued to acquire all literature related to intelligence analysis. We also expanded our effort to acquire information in subjects deemed potentially relevant to intelligence analysis.

We used a selective approach to acquire publications from various subject areas. We did not attempt to acquire all the available information in a given subject area. We made selections on an iterative basis. First, we acquired and reviewed a limited sample of information from a subject area. We then made a judgment about the potential relevance of the information for understanding the cognition of intelligence analysis. If the content of the information was judged as potentially relevant, we acquired literature for that subject using an approach comparable to that done for the intelligence literature.

Our overall information acquisition on all subject areas resulted in a large number of potentially relevant publications. We based the *Advanced Analysis Cognition* research on the full text of over 5,800 documents consisting of nearly 172,000 pages.

2.2 Information Assessment - Method

We used the methods associated with qualitative research synthesis[4] to evaluate the acquired literature, particularly those techniques elaborated by the Cochrane Collaboration.[5] The main phases for doing such research are:

- Problem formulation
- Literature search
- Data evaluation
- Analysis and interpretation
- Public presentation

This method is very similar to the analysis process as proposed by Kent.

1. The appearance of a problem requiring the attention of a strategic intelligence staff.
2. Analysis of this problem to discover which facets of it are of actual importance to the U.S. and which of several lines of approach are most likely to be useful to its governmental customers.

3. Collection of data bearing upon the problem as formulated in Stage 2. This involves a survey of data already at hand and available in the libraries of documentary materials, and an endeavor to procure new data to fill in gaps.
4. Critical evaluation of the data thus assembled.
5. Study of the evaluated data with the intent of finding some inherent meaning. The moment of the discovery of such a meaning can be called the moment of hypotheses. In reality there is rarely such a thing as one moment of hypothesis though some students of method, largely as a convenience, speak as if there were. Nor can it be said categorically at what stage in the process hypotheses appear. One would be pleased to think that they appeared at this, the respectable Stage 5, but in actual practice they begin appearing when the first datum is collected. They have been known to appear even before that, and they may continue to appear until the project is closed out—or even after that.
6. More collecting of data along the lines indicated by the more promising hypotheses, to confirm or deny them.
7. Establishment of one or more hypotheses as truer than others and statement of these hypotheses as the best present approximation of truth. This stage is often referred to as the presentation state *[sic]*.[6]

Comparing the two descriptions illustrates the commonality of both approaches for assigning meaning and drawing conclusions from information. From a cognitive standpoint, doing qualitative research and intelligence analysis are the same. We found the use of the Cochrane Collaboration approach to be a natural complement to our previous intelligence analysis work.

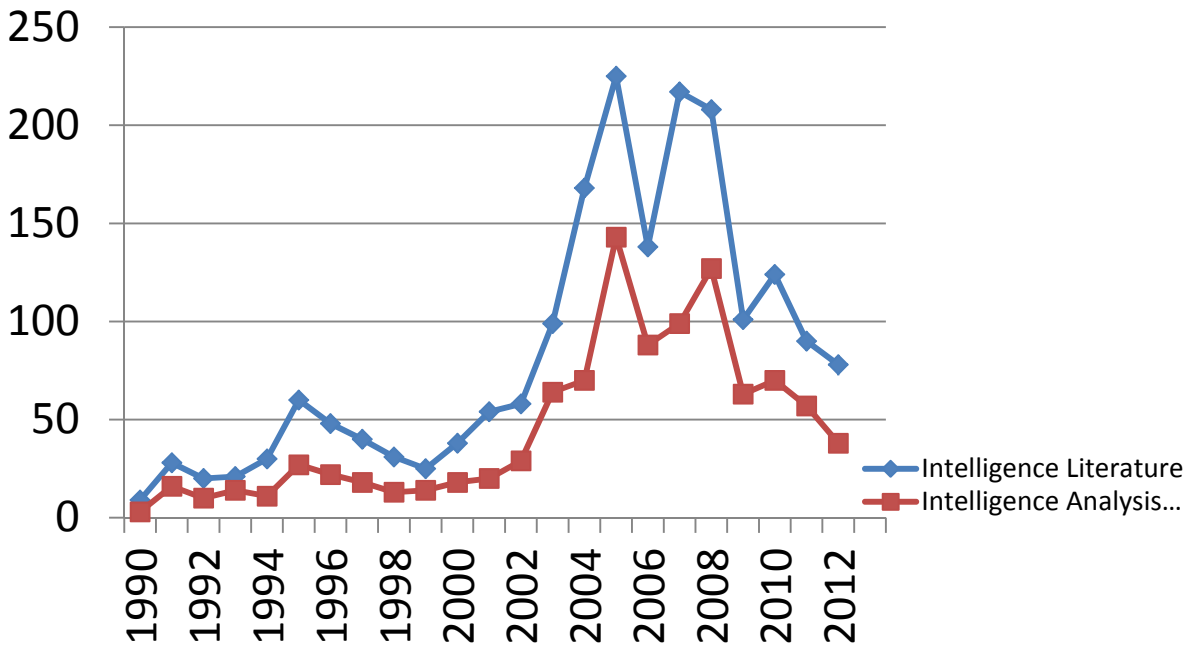
3.0 STATE OF THE INTELLIGENCE LITERATURE

In our ongoing review of the intelligence literature, we included as relevant any publications that contained information pertaining to the following topics:

- organization and management of the intelligence community
- analysis process and products
- intelligence failure
- analysts' characteristics
- training
- analytical work and management environment
- tools for augmenting analysis

Our intelligence literature reviews did not include searching for information on pre-WWII intelligence history, memoirs, and collection techniques. If an item seemed to be only marginally relevant, we made it a policy to include the item rather than to exclude it from our collection.

After collecting intelligence literature based on these selection criteria we were able to use data about our collection to plot trends in publishing for intelligence analysis. Figure 1 shows the results of analyzing our collection.



Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

Figure 1: Volume of Intelligence Literature 1990 -2012[7]

We had initially performed this analysis in 2010 and noted in our final report for *State of Knowledge* that the publication volume was decreasing. Our current update of the same analysis shows an even greater decline in publication volume. We can offer no better explanation for the decrease in the amount of intelligence literature than we could two years ago:

> One can only speculate as to why the volume of intelligence literature has decreased in the last two years. One view is that intelligence failures spark an outpouring of publications dealing with why there was a failure and recommendations for preventing future failures. Certainly, the failures associated with 9-11 and the Iraqi Weapons of Mass Destruction (WMD) have been addressed in many publications. Perhaps without new failures, there may be a dearth of topics to write about that have not been extensively treated in the prior intelligence literature. Another possibility is that given the descriptive nature of the intelligence literature, the question is what can be said that hasn't already been said. For example, the first instance of the term *mirror imaging* that we found in the intelligence literature was in a 1960 publication.[8] The most recent instance of the term is in a 2010 publication.[9] The basic message has not changed over this 50-year period: mirror imaging is bad and an analyst shouldn't do it. The same is true for other concepts such as alternative analysis and Analysis of Competing Hypotheses (ACH). Both have been discussed for a long time, but there has been little change in the content of the discussion.[10]

Even in the context of the decrease in volume, fewer publications are dealing with the topic of improving the quality of intelligence analysis. The notable exception is the publication produced by the Committee on Behavioral and Social Science Research to Improve Intelligence Analysis for National Security; National Research Council.[11]

One topic that has gained more prominence in the last few years is field evaluation of intelligence analysis - "the testing of these methods and tools in the context in which they will be used in order to determine if they are effective in real-world settings."[12] A workshop addressing this issue was conducted by the Committee on Field Evaluation of Behavioral and Cognitive Sciences-Based Methods and Tools for Intelligence and Counterintelligence. The major findings of this workshop were that new tools and techniques were introduced without field evaluation. Others have also made this observation.

---

[7] The absolute value of the number of publications should be used with reservations since the numerical value is based on a series of subjective judgments. However, a constant framework was used for making these judgments so the relative value of numbers is considered valid. Thus, the trends depicted are real.

> Many methods used by or proposed to the Intelligence Community (IC) have not been formally evaluated using randomized controlled trials. For example, intelligence analysis tradecraft not evaluated adequately include alternative competing hypotheses, Preliminary Credibility Assessment Screening System (PCASS), and even recent communication innovations such as Intellipedia and A-Space.[13]

> Analysts who do not use structured analysis often justify their decision by claiming there is no hard evidence that these techniques improve analysis. It is true that little has been done to validate empirically the utility of these techniques as used in intelligence analysis, to formally assess the impact on the workload of analysts using these techniques or their supervisors, or to conduct systematic customer evaluation of products that have used structured techniques. This absence of proof of effectiveness makes it harder to "sell" analysts on the use of these techniques, especially analysts who claim they do not have enough time to use structured analytic techniques.[14]

The assessment we made of the content of intelligence publications in the *State of Knowledge* final report remains valid:

> …the content of the intelligence literature has not changed in meaningful ways over time. The focus has been on describing the shortcomings in the analysis process and discussing what the analyst should not do. Suggested improvements and reforms have been put forth repeatedly, but the analysis of why these reforms do not succeed is lacking. Very little of the writing has addressed improvement at the fundamental level where analysis is done, i.e., by the intelligence analyst, and addressed how analytic practices should be approached comprehensively to overcome the often identified shortfalls.[15]

What should be added to our original assessment as a result of more research is a note reflecting the lack of validation of the tools and techniques for doing intelligence analysis. Despite many claims and anecdotal information, whether any of these tools and techniques actually improves the results of intelligence analysis has yet to be proven.

4.0 RELEVANT SCIENTIFIC RESEARCH

As we mentioned earlier, intelligence analysis is an intensely cognitive process involving information processing, information evaluation, and judgment making. Because of the broad nature of these cognitive processes, many areas of scientific research have the potential to inform the practice of intelligence analysis. Investigating these areas of research can shape the practice of intelligence analysis to be consistent with current scientific findings. The specific topics of interest that we pursued included:

Critical thinking	Thinking dispositions	Epistemological beliefs
Conceptual change	Information retrieval	Reasoning
Group behavior	Practice based learning	Persuasiveness
Self-efficacy	Rationality	Reception theory
Dual process mind	Thinking styles	Competence evaluation

The following sections of the final report discuss the major findings from the research synthesis work for critical thinking, thinking dispositions, epistemological beliefs, and practice-based learning. We completed research syntheses for critical thinking and thinking dispositions. We were able to partially complete research syntheses for epistemological beliefs and practice-based learning.

5.0 CRITICAL THINKING

5.1 Introduction

Beginning in the late 1990s, the specific topic of *critical thinking* has been increasingly mentioned as one of the "fixes" to improve the quality of analysis. James Asker was one of the earliest authors to highlight critical thinking:

> Grumbling lawmakers say the intelligence failure to detect India's nuclear test preparations was rooted in defects flagged long ago, but continually sidestepped by both Congress and spy agencies. A quick review led by Admiral David Jeremiah, a former vice chairman of the Joint Chiefs of Staff, produced a litany of familiar flaws: lack of critical thinking and analytic rigor, weak internal coordination, botched collection priorities, and too much reliance on technical intelligence-gathering, too little on spies.[16]

Stephen Marrin, bringing critical thinking more explicitly to the attention of the intelligence community, included this quote in several of his articles published from 2002-2004[17] about improving intelligence analysis. Marrin was one of the first to emphasize the need for critical thinking.

Stephane Lefebvre also highlighted the importance of critical thinking in 2003:

> If we accept the cognitive model developed by Operating Systems, Inc. as valid, then it becomes clear why analysts must be trained and encouraged to develop the necessary skills to think critically and innovatively. Objectivity is, as Michael Herman argues, an 'elusive ideal.'58 This is important if intelligence analysts are to produce estimates that are as unbiased and free of logical fallacies as possible. To wit, if anything should be taken for granted it is the centrality of critical reflection, or boundary exploration and critique, to all forms of analysis. It is perhaps a poor reflection on the current analytical culture that critical thinking as an activity has to be made explicit.59 [18]

Major George E. Lewis III also wrote about how the lack of critical thinking contributed to intelligence failures in a document published in 2005:

> Short of a lack of information, failures in thinking are perhaps the number one reason behind intelligence failures. Failures or the inability to recognize bias, understand cultural deviations, and ignoring alternative premises are only a few of the traps that an intelligence analyst can fall prey to if he/she cannot think critically. Of the eight critical

> skills within the core competencies of intelligence analysts, critical thinking is the most crucial and is often the least trained.[19]

In the years following the identification of the importance of *critical thinking*, it has appeared on lists of analyst competencies, is increasingly included in analyst training curricula, and is now mentioned explicitly in governing documents such as *The US Intelligence Community's Strategic Human Capital Plan*.[20] Yet it is not always clear what anyone means when the term *critical thinking* is used nor how to develop the competency in analysts in order to improve the analysis process and reduce failures caused by "a lack of critical thinking."

Noel Hendrickson noted the ongoing lack of understanding of critical thinking in intelligence analysis in 2008:

> Critical thinking appears on almost every list of the essential skills for intelligence analysts. But any corresponding attempt to define critical thinking more precisely is seldom encountered. And, on those rare occasions when definitions are offered, they inevitably (albeit quite understandably) amount to new applications of existing approaches. Yet, these existing approaches derive from more general academic attempts to create better thinkers and not from any specific concern for the problems of intelligence analysis. Thus, despite the undeniable importance of critical thinking in intelligence analysis, few if any attempts are made to define critical thinking specifically for intelligence.[21]

In support of Hendrickson's statement, we found a total of 21 intelligence analysis documents that contained definitions for critical thinking. Seventeen of the items had been published during or before 2008. Seven of the documents referenced existing scholarly definitions, 13 of the documents provided new, unique definitions, and some did both. No reports provided information on how critical thinking improves intelligence analysis nor gave any insight into which version of critical thinking might be the most useful for intelligence analysis.

Critical thinking's multiple definitions, the varied descriptions of how to apply critical thinking to intelligence analysis, and the lack of information demonstrating the benefit of critical thinking illustrate the need for a better understanding of critical thinking and how it might support effective intelligence analysis. While we can intuitively accept that improvements in cognitive processes described by the term *critical thinking* can improve analysis, it would be beneficial to reach agreement on specifically what leads to the desired cognitive improvements, including such topics as thinking skills, thinking dispositions, and effective training.

5.2 Purpose

The purpose of the research synthesis was to provide an understanding of the concept of critical thinking, how the concept is represented in the intelligence literature, and its potential applicability to intelligence analysis. We hoped to learn:

- What is critical thinking?
- What is the state of knowledge regarding critical thinking?
- Can we train someone to think critically?
- Can we assess someone's ability to think critically?
- How can this understanding of critical thinking be applied to improving intelligence analysis?

5.3 Findings

The answers to the basic questions that guided this research were:

1. *What is critical thinking?* We do not have a clear answer.
    a. Although critical thinking is generally recognized as important (and scholars in all disciplines in this study make this case emphatically), a formal agreement on what critical thinking is does not exist either within the intelligence community or within other disciplines. However, common themes do exist that clarify critical thinking and identify its potential usefulness in intelligence analysis.
    b. Critical thinking is a concept describing a quality of thinking. It refers to *how* one approaches the thinking task. Critical thinking is useful when exploring a situation, phenomenon, question, or problem to arrive at a hypothesis or conclusion about it that integrates all available information and that therefore can be convincingly justified.
    c. Skills and dispositions such as those listed in Table 1 are *hows* that might be especially useful in contributing to the quality of thinking called critical thinking. As a quality of thought, critical thinking can and potentially should be applied to every part of intelligence analysis.

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

Table 1: Recommended Critical Thinking Skills and Dispositions for Intelligence Analysts

Critical Thinking Skills	Critical Thinking Dispositions
Interpretation	Willingness to engage in intellectual effort
Analysis	Systematic
Evaluation	Persistent
Inference	Intellectual integrity
Synthesis	Open-minded
Explanation	Intellectual curiosity
Self-regulation	

2. *What is the state of knowledge of critical thinking?* The best description of the current state of knowledge was provided by Condon and Riley: "The current literature on critical thinking is rife with conflict and competing ideologies."[22]
    a. Examples supporting this statement include the many different definitions, lists of skills and kinds of skills, and models of critical thinking that I found in the literature.
    b. Little attention has been devoted to critical thinking performance – are individuals with strong critical thinking skills and dispositions as measured by assessments able to perform better in work that appears to require critical thinking? This shortcoming is as apparent in the intelligence literature as it is in the literature from other disciplines.
3. *Can we train someone to think critically?* Perhaps.
    a. Much of the education and training available to date in university courses, publicly available courses, and courses intended specifically for the intelligence community are based on simplistic descriptions of critical thinking, provide insufficient time for effective practice, use ineffective teaching strategies, and include few or ineffective methods of assessing what has been learned.
    b. Training that has been effective as demonstrated by performance on some sort of assessment was developed to teach a specific set of skills, dispositions, and operations in order to achieve a specific outcome.

[22] Condon, W. & Kelly-Riley, D. "Assessing and Teaching What We Value: The Relationship between College-Level Writing and Critical Thinking Abilities," *Assessing Writing*, Vol. 9, No. 1, 2004, p. 64.

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

Successful training has been focused, well-designed, and consistently delivered, with extensive opportunities for practice.

4. *Can we assess someone's ability to think critically?* Again, perhaps.
   a. A number of standardized assessments and examples of customized assessments exist that address different aspects of critical thinking. It is not clear whether any of the currently available standardized assessments are beneficial for the intelligence community. Few documents were found that described assessments designed for adults to be used in determining job readiness, suitability, or performance.[23] No documents were found describing how to assess whether someone uses critical thinking regularly in his or her job or life.
   b. Each publicly available assessment is somewhat different, focused on the critical thinking definition espoused by the assessment author.
   c. Publicly available assessments have primarily been used in assessing the impact that a class or an experience such as years in college has on the ability to think critically. That is, they assess an experience's impact at Level 2 in Breckenridge's schema.[24]
   d. Several documents provided guidelines for developing a custom assessment (i.e. rubrics) that could be designed for a unique environment such as the intelligence community. Those publications also provided examples of custom assessment tools.
5. *How can this understanding of critical thinking be applied to improving intelligence analysis?* The intelligence community needs to exert additional effort in order to benefit from investments in critical thinking.
   a. Critical thinking is widely recognized as an important competency for intelligence analysts. However, the intelligence community does not yet have a common understanding of what critical thinking is or how to apply it in intelligence analysis work. Without a common understanding of critical thinking, the claims regarding its ability to improve intelligence analysis, the investments in training for it, and documents such as strategic plans calling for critical thinking are built on a weak foundation. Which version of critical thinking is expected to improve analysis? What critical thinking competencies will result in better analysis? How would critical thinking be recognized if it were present?
   b. Current training in the intelligence community varies widely. Courses exist with different definitions of critical thinking, a variety of topics covered, and varying amounts of practice available, resulting in analysts who have

[23] One exception is a study of using the Watson Glaser Critical Thinking Assessment in hiring intelligence analysts completed in 1983.
[24] Breckenridge, J.G. "Designing Effective Teaching and Learning Environments for a New Generation of Analysts," *International Journal of Intelligence and Counterintelligence*, Vol. 23, No. 2, 2010, p. 308.

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

differing levels of critical thinking knowledge and abilities. Many courses are primarily designed to introduce analysts to the *concept* of critical thinking. These courses do not provide sufficient depth or time for practice that would enable an analyst to become a skilled critical thinker. I found no reports of training evaluations that demonstrated that the courses actually improved analyst competencies or performance.

c. Although it is widely believed that critical thinking will improve intelligence analysis, we found no reports demonstrating the benefit of critical thinking to intelligence analysis.

5.4 Recommendations

These findings provide a roadmap for research and activities that will demonstrate the utility of critical thinking to the intelligence community. These activities will also identify the best way to integrate critical thinking into intelligence analysis to gain maximum benefit throughout the entire intelligence community.

1. Define a concept of critical thinking that makes sense for intelligence analysis and that can be accepted throughout the intelligence community. This definition should:
   a. Identify expected standards of critical thinking in intelligence analysis using techniques such as rubrics.
   b. Identify the appropriate skills, dispositions, and personal epistemology maturity level needed for effective intelligence analysis.
   c. Clearly articulate how to apply critical thinking in intelligence analysis.
2. Evaluate the various aspects of critical thinking prior to making major investments in fostering it throughout the intelligence community. Research projects might include:
   a. Investigating the impact that improved critical thinking skills and dispositions have on intelligence analysis.
   b. Determining an approach to training (including topics, teaching strategies, and practice mechanisms) that will provide the most improvement to the practitioners of intelligence analysis.
   c. Evaluating publicly available assessments and their usefulness for assessing an analyst's skills or dispositions and therefore predicting job performance or identifying training needs.
   d. Evaluating whether assessments of critical thinking skills, dispositions, and personal epistemology are useful in the hiring process.
3. Develop a consistent critical thinking training curriculum that includes topics that have been demonstrated to improve intelligence analysis and that uses best practices in skills training. Rigorously evaluate the effectiveness of the training and make appropriate improvements until the training meets the needs of the intelligence community.
   a. Successful experiments exist that provide models of effective instruction.

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

b. The training used in nursing education provides a cautionary tale of training approaches to avoid.

4. Determine the best way to assess the thinking skills and dispositions of analysts and their ability to apply critical thinking to the analysis process. Develop an assessment methodology that measures not only the results of training, but the impact of that training on analytic results.

   a. For example, rubrics provide information that is not only useful for assessment, but also useful in identifying performance expectations in advance. An analyst could use a rubric to guide his or her work efforts and evaluate his or her own analytic products.[25]

[25] Marsh, M. *Advanced Analysis Cognition: Critical Thinking*, March, 2012 is the complete report of this research synthesis. It is in press at the time of the current final report for the Advanced Analysis Cognition effort.

6.0 THINKING DISPOSITIONS

6.1 Introduction

Everyone agrees that intelligence analysis is an intensely cognitive process and that the quality of an analyst's cognition determines the quality of his or her analysis. However, less is understood about what elements combine to make productive, effective cognition.

Richards Heuer noted this challenge in *Psychology of Intelligence Analysis*:

> Of the diverse problems that impede accurate intelligence analysis, those inherent in human mental processes are surely among the most important and most difficult to deal with. Intelligence analysis is fundamentally a mental process, but understanding this process is hindered by the lack of conscious awareness of the workings of our own minds.[26]

Thinking dispositions are a theoretical construct intended to describe one aspect of cognition. They describe a person's *inclination* or *motivation* to make an effort to use one's mental skills to address tasks requiring thinking.

The *Framework for Analytic Cognition (FAC): A Guide for Doing All-Source Intelligence Analysis*[27] noted the contribution that thinking dispositions make to effective cognition:

> While there are many unknowns about how people think and various terms are used, the preceding discussion indicates the following factors are important.
>
> - Knowledge
> - Thinking dispositions
> - Cognitive skills
> - Motivation and engagement
> - Epistemological beliefs

Advanced Analysis Cognition: Critical Thinking.[28] Also highlighted the importance of thinking dispositions to effective thought:

> The ability to employ critical thinking skills is still not sufficient to ensure that an individual will bring a critical approach to thinking. A thinker must be willing to make the extra effort to think critically. The thinker must have the *disposition* to think critically

The earliest scholars interested in improving thinking highlighted the importance of attitude. For example, John Dewey noted that a thinker needs more than skills in *How We Think*.

> Knowledge of the methods alone will not suffice; there must be the desire, the will, to employ them. This desire is an affair of personal disposition. But on the other hand the

[28] Marsh, M. *Advanced Analysis Cognition: Critical Thinking*, in press.

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

> disposition alone will not suffice. There must also be understanding of the forms and techniques that are the channels through which these attitudes operate to the best advantage.[29]

Edward Glaser described the importance of thinking dispositions in his 1938 experiment regarding teaching critical thinking:

> The development of ability to think critically, it should be noted, is not limited to cultivation of better methods for finding and testing evidence and meanings, and arriving at well-founded conclusions. Knowledge of the methods of logical inquiry is important. Even more important for the everyday practice of democracy, however, are the *attitudes* involved in critical thinking. Persons who have acquired a disposition to *want* evidence for beliefs, and who have acquired an attitude of reasonableness have also acquired something of a way of life which makes for more considerate and humane relationships among men.[30]

Our understanding of the contribution of thinking dispositions toward effective thinking led us to explore further what has been researched about thinking dispositions. We hoped to determine if improving positive thinking dispositions could benefit the intelligence analysis process.

6.2 Purpose

Our primary research questions were:

> What is the value and feasibility of evaluating a candidate's thinking dispositions as one component of intelligence analyst selection? What is the feasibility of training individuals in order to strengthen their positive thinking dispositions?

To answer these questions, we explored the following topics:

- What are thinking dispositions?
  - How are they described? Do different professional disciplines have different perspectives on thinking dispositions?
  - How are they related to various descriptions of thinking such as critical thinking, reflective thinking, or rational thinking?
  - Are related concepts that describe the affective or motivational aspects of human cognition present in their literature?
  - How have thinking dispositions been understood over time?
- How do thinking dispositions affect cognitive performance?
  - How do individuals use their thinking dispositions while performing cognitive tasks?
  - Does the use and influence of thinking dispositions vary depending on the nature of the cognitive task?

[29] Dewey, J. *How We Think: A Restatement of the Relation of Reflective Thinking to the Educative Process*, 2nd ed., Regnery, Chicago, IL, 1933, p. 30.
[30] Glaser, E.M. *An Experiment in the Development of Critical Thinking*, AMS Press Inc., New York, NY, 1941, p. 6.

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

- Can thinking dispositions be assessed? Do reliable and valid assessment methods exist? What evidence exists that supports the value of thinking disposition assessments?
- How do thinking dispositions relate to the characteristics, attributes, and traits of intelligence analysts?
- How are an individual's thinking dispositions established or subsequently changed?
  - What factors influence the development of various thinking dispositions?
  - Can thinking dispositions be improved with training and education or other factors such as life experience or maturity? What evidence exists for this improvement?

6.3 Findings

The primary questions guiding this research were:

> What is the value and feasibility of evaluating a candidate's thinking dispositions as one component of intelligence analyst selection? What is the feasibility of training individuals in order to strengthen their positive thinking dispositions?

Based on the results of this research, we believe it is practical and valuable to use thinking dispositions as one component of intelligence analyst selection. The research also shows that training intelligence analysts to improve their thinking dispositions can have a positive impact on their cognitive activity.

The findings that contributed to these conclusions include:

1. What are thinking dispositions?
   a. Thinking dispositions represent an individual's inclination toward thinking. An individual's strength in positive or productive thinking dispositions identifies *whether someone is likely to notice when effortful thinking is required and the degree of inclination to make the effort when thinking is required*. This description is accepted across academic disciplines and has remained consistent over time.
   b. Thinking dispositions that might be useful for intelligence analysts include:
      - Enjoyment of cognitive effort
      - Intellectual curiosity
      - Open-mindedness
      - Intellectual honesty
      - Tolerant of ambiguity
      - Focus on evidence
      - Persistent
      - Systematic
2. How do thinking dispositions affect cognitive performance?

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

a. It is clear that thinking dispositions are a trigger for cognitive activity. When an individual is *disposed* to think, he or she makes the effort to engage cognitively.

b. The specific thinking dispositions possessed by an individual and the relative strength of individual thinking dispositions influence the degree to which an individual makes an effort to:

- Engage cognitively at all
- Override personal beliefs and biases to ensure an open-minded approach to the task
- Thoroughly investigate a situation in order to find relevant information and to look at all sides of an issue
- Avoid premature closure of the thinking task and exhibit the willingness to tolerate lack of a clear answer (ambiguity) while investigation continues
- Reach a conclusion only after finding sufficient evidence to support the conclusion

c. Psychologists who have conducted experiments into cognitive performance have found that thinking dispositions can predict the outcome of cognitive performance after intellectual ability (IQ) has been considered.

3. Can thinking dispositions be assessed? Are there reliable and valid methods for assessment?

   a. Thinking dispositions can be assessed and a variety of different assessments exist.[31],[32],[33],[34]

4. How do thinking dispositions relate to the characteristics, attributes, and traits of intelligence analysts?

   a. Where scholars described disposition-like attributes of intelligence analysts, a significant overlap with thinking dispositions does exist. The thinking dispositions we have identified are recognized as important contributors to analytic success.

5. How are an individual's thinking dispositions established or subsequently changed?

   a. Thinking dispositions are believed to be developed by the environment and culture in which an individual lives. A family or school setting can foster positive or negative thinking dispositions and can strengthen or weaken

88ABW-2013-5245; Cleared 12 December 2013

thinking dispositions by what is modeled, expected, and rewarded in the culture surrounding the thinker.

b. Positive thinking dispositions can be strengthened by instruction and practice. Both aspects of training, that is, creating a culture that expects effective thinking and explicitly teaching for positive thinking dispositions, appear to be valuable.[35]

c. One critical success factor appears to be ensuring sufficient practice for the positive thinking dispositions to become entrenched and habitual.

d. A workplace culture can encourage and strengthen positive thinking dispositions by expecting cognitive behaviors and outcomes that rely on positive thinking dispositions.

6.4 Recommendations

In order to gain maximum benefit from the use of a thinking dispositions assessment in the selection of analysts, the intelligence community should:

1. Conduct a comprehensive job analysis to identify the specific traits and characteristics needed by intelligence analysts. Using this job analysis, identify which specific thinking dispositions have the most positive impact on analytic performance.

   Numerous authors have described various traits and capabilities of the ideal intelligence analyst. These traits are, however, anecdotal. The intelligence community should use the existing intelligence literature as a starting point for developing what might be considered a definitive description of the needed competencies and traits of an intelligence analyst. This description should include thinking dispositions.

2. Purchase, adapt, or develop assessments that measure the strength of an individual's thinking dispositions.

   Once an understanding of analyst competencies, dispositions, and other traits exists, develop an assessment that addresses, at a minimum, the thinking dispositions a candidate has. The many assessments found in this study provide a starting point for the intelligence community. Although not all assessments identified in this study were found to be equally reliable and valid, they are a source of potentially useful questions and approaches that might be included in the selection process for intelligence analysts.

3. Validate that the assessment is useful in identifying individuals with thinking dispositions that have a positive impact on intelligence analysis.

   Because of the potential impact of using a thinking dispositions assessment in intelligence analyst selection, care must be taken to ensure that the assessment tool is valid and useful for selection. Although intelligence analysis does not lend itself to quantitative evaluation such as sales quota achievement, it is possible to

[35] Perkins, D.N., Jay, E. & Tishman, S. "Beyond Abilities: A Dispositional Theory of Thinking," *The Merrill-Palmer Quarterly,* Vol. 39, No. 1, 1993, pp. 16-17.

88ABW-2013-5245; Cleared 12 December 2013

experimentally assess the impact of thinking dispositions on an individual's analytic results. The experiments conducted by Stanovich, for example, provide a model for how this might be done.[36] An essential ingredient of the experiment would be a standard repertoire of intelligence problems and databases tailored to the participants' specialties. The experiment would include a solution for each problem that represents the best analysis that can be accomplished given the information in the databases. Experiment facilitators would use these solutions to evaluate each participant's analysis and would be able to compare analytic results with thinking disposition assessment results.

4. Validate that the assessment is fair and does not inappropriately exclude any individual or classes of individuals.

   Ensure that the assessment will meet the "Uniform Guidelines on Employee Selection Procedures" as defined by the Equal Employment Opportunity Commission, the Civil Service Commission, the Department of Labor, and the Department of Justice. These can be found at http://www.uniformguidelines.com/uniformguidelines.html.

5. Strengthen the thinking dispositions of intelligence analysts already at work in the intelligence community by improving intelligence analyst training programs. The goals of these improvement efforts are to ensure that the training culture fosters positive thinking dispositions and includes specific training on thinking dispositions.
6. Ensure the work environment continues the enculturation process through its efforts to expect, strengthen, and reward strong positive thinking dispositions.[37]

7.0 PRACTICE-BASED LEARNING

7.1 Introduction

One of the recommendations developed as a result of the *State of Knowledge* contract was:

> Establish a training course using the handbook proposed in Recommendation 4. This would include using the procedures taught for performing the complete analysis process. The approach to training would incorporate procedures and exercises designed to accommodate context sensitivity. Accordingly, an essential ingredient of the training is a standard repertoire of intelligence problems and databases tailored to the students' specialties. The course will provide a solution for each problem that represents the best analysis that can be accomplished given the information in the databases. Course facilitators will use these solutions to evaluate each student's analysis. Each student would also be able to compare his or her results with what an expert has accomplished.

This recommendation implied certain content in the training intervention: learning the content of the handbook (eventually developed as the *Framework for Analytic Cognition(FAC)* and putting what has been learned into practice. The issue researched further in the effort under review was how to best design and develop such a training course, with particular emphasis on the practice component.

Based on the nature of intelligence analysis, the FAC, research done during the *State of Knowledge* contract, and the philosophical outlook of the FAC team, a performance improvement intervention designed with a practice based learning approach seemed to be the most appropriate method for achieving the best training outcomes. The goal of the current study was to validate this approach.

7.2 Purpose

Our goal was to be able to make informed recommendations regarding how best to incorporate practice based learning into an educational experience for the FAC. We hope to be prepared to participate in various course development efforts such as course design, material development, instructor and student selection and coaching, course reviews, and pilot courses. We intended to be able to provide guidance to any organizations wishing to implement an educational program based on the FAC.

We designed this effort to concentrate on three broad areas:

1) What is practice based learning?
2) Is practice based learning the optimal approach for developing an intelligence analyst's ability to use the FAC? That is, was practice based learning, as recommended in the final report of the *State of Knowledge* effort, the correct recommendation?
3) If practice based learning is the optimal approach for the FAC in general, are there some aspects of the FAC that are especially amenable to being learned through practice based learning?

The effort was not intended to be an exhaustive review of practice based learning. Our work on this portion of the contract did not review classic training approaches such as lecture, online

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

learning, or workshops, except for suggestions about how they are best integrated into a practice based learning environment. This effort also did not review basic course development methodologies.

7.3 Findings

Practice based learning is a variation of *problem based learning*, adapted to a variety of occupations. Problem based learning has the following characteristics:

1. A student-centered approach that relies on the learner to identify and review knowledge needed to resolve a case
2. Use of an authentic problem introduced to the tutorial group prior to any preparation or study
3. Synchronous small group collaborative work supported by a faculty facilitator, combined with self-directed study to investigate learning issues that arise from problem discussion
4. Use of the problem and tutorial discussion of the problem as vehicles to identify the required knowledge (facts and concepts) as well as problem-solving skills to resolve it[38]

Billett provides a useful definition of practice based learning:

> Before proceeding further, it is important to capture what constitutes practice and then learning through practice. The definition taken here of practice is that which occurs through the usual or everyday exercise of the occupation. That is, practice comprises the enactment of the kinds of activities and interactions that constitutes the occupation. This is referred to as *praxis* in some traditions, and is used to distinguish between practice and theory. Here, however, it is assumed that practice is enacted through access to and the exercise of forms of conceptual, procedural, and dispositional knowledge that underpin competent practice. Moreover, learning through practice is seen as a process that arises through the exercise of the occupational practice, and there is no distinction between engaging in practice and learning. Certainly, the process of learning is now widely acknowledged as being a ubiquitous and ongoing activity that is a necessary part of everyday conscious thinking and acting. In essence, the process of humans' construal and construction of experience constitutes learning. There is also no privileging of particular settings as sites of learning, except through the qualities of activities and interactions (i.e., experiences), because it is what and how individuals construe and construct from their experiences that ultimately shapes what they learn, not necessarily what social settings intend them to learn or even press them to learn (Billett, 2009a).[39]

We first encountered the term practice based learning as it was associated with the medical profession. Practice based learning seemed to be a good model for intelligence analysis as many

of the cognitive challenges faced by physicians are similar to those faced by intelligence analysts.

As with many of the other topics studied during *Advanced Analysis Cognition*, developing a definition for the subject of the study was the first research challenge. While *practice based learning* is not widely used in the literature, *problem based learning* is found frequently and used in many different contexts. We searched the literature for both of these terms and then expanded the search to include learning approaches such as action learning, active learning, experiential learning, project-based learning, inquiry-based learning, professional learning, problem-centered instruction, situated learning, self-directed learning, and cognitive apprenticeship.

The planned outcome for this research was to develop a concise characterization for each topic that includes a definition, a description of how it is typically used, and a list of each approach's strengths and weaknesses. The characterization for each approach was to help the team and others validate the recommendation of practice based learning for the FAC.

7.4 Recommendations

We obtained and reviewed over 50 publications in order to develop an issue statement, analysis plan, and acquisition plan for this research effort. Unfortunately, work was suspended on the contract before we could make any further progress on this task. Therefore, the chief recommendation arising from this effort would be to continue our research and assessment efforts in order to address all of the questions set forth in the "Purpose" section of this document.

8.0 EPISTEMOLOGICAL BELIEFS

8.1 Introduction

General agreement exists that the cognitive domain as applied to decision making, problem solving or assigning meaning consists of knowledge, comprehension, application, analysis, synthesis, and evaluation.[40] However, this description of the cognitive domain does not discuss the precursor functions used to establish the knowledge used during cognition. Researchers have investigated many facets of what determines the ability of an individual to acquire knowledge. One of the results of this research is the identification of epistemological beliefs, i.e., beliefs about the nature of knowledge, and their critical role in knowledge acquisition.[41] [42]

8.2 What are Epistemological Beliefs?

What are epistemological beliefs? This is one description:

> …CERTAINTY of knowledge, ranging from knowledge is absolute to knowledge is tentative…
>
> …STRUCTURE of knowledge, ranging from knowledge is organized as isolated bits and pieces to knowledge are organized as highly interwoven concepts…
>
> …SOURCE of knowledge, ranging from knowledge is handed down by authority to knowledge is derived through reason…
>
> …CONTROL of knowledge acquisition, ranging from the ability to learn is fixed at birth to the ability to learn can be changed…
>
> …SPEED of the knowledge acquisition, ranging from knowledge is acquired quickly to not-at-all to knowledge is acquired gradually.[43]

Epistemological beliefs at the lower end of the continuum (e.g., knowledge is absolute, organized in isolated bits and pieces, handed down by authority, with the ability to learn fixed at birth) are characterized as naïve beliefs. Those beliefs at the upper end of the continuum (e.g., knowledge is tentative, organized as interwoven concepts, derived through reason, with an ability to learn that can change) are characterized as sophisticated beliefs.[44]

There are many variants in definitions of epistemological beliefs. However, at the core of all these definitions is the question of whether knowledge is absolute or tentative.

8.3 Findings

The work of Perry published in 1970 is generally agreed to mark the beginning of research on epistemological beliefs.[45] Since then the amount of publication dealing with epistemological beliefs has steadily increased. The general attributes of the published research are:

- The preponderance of the research has been directed at relating epistemological beliefs to learning. Little disagreement exists that higher (more sophisticated) levels of epistemological beliefs lead to improved performance in learning.
- The most frequent research subjects are children and adolescents in K-12 settings. Less work has been done on college students and even less on graduate students. Almost no work has been done with adults who have completed their formal education.
- The epistemological beliefs of teachers, both in training and in practice, have been investigated. The major point of interest was how their beliefs shaped their practice of teaching. Of particular note is that conflicts often exist between the teacher and the educational system. The educational system often pushes a pedagogical program as if knowledge is certain, while teachers new to the profession have more sophisticated beliefs.
- Research on the effect of epistemological beliefs on problem solving showed an almost one-time spurt of interest. Only a couple of reports on epistemological beliefs and work related task have been reported. These meager data do suggest that performance improves with a more sophisticated epistemological belief structure.
- A frequent current topic is the effect of culture on epistemological beliefs. As might be expected, most of the authors of these publications are not US-based.
- A variety of techniques have been developed to measure epistemological beliefs. The techniques are either interviews or a paper and pencil test. The variation in the techniques and what is being measured is very dependent on the researcher's definition of epistemological beliefs. However, regardless of how defined or measured, the same general pattern is observed: performance improves with increasing sophistication of epistemological beliefs.
- General acceptance exists that epistemological beliefs can be changed. The conditions that foster these changes have not been thoroughly addressed other than the observation that change occurs with increasing amount of education.

Given the preponderance of research relating educational performance conducted by people who are part of the educational system, the lack of research outside of the educational environment is not surprising. Most surprising is the lack of research on the relationship between thinking dispositions and epistemological beliefs. Intuitively one would expect that a sophisticated level of epistemological beliefs would correlate with a high level of thinking dispositions or vice

[45] Perry, W.G. *Forms of Intellectual and Ethical Development in the College Years: A Scheme*, Holt, Rinehart and Winston, New York, NY, 1970.

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

versa. For example, a person who believes knowledge is certain will have weaker evidence of thinking disposition characteristics such as keeping an open mind.

A second major omission in the research on epistemological beliefs was mentioned above: almost none has been done with adults who have completed their formal education. Anecdotal information from other areas suggests that epistemological beliefs become less sophisticated as people age.

8.4 Recommendations

In summary, epistemological beliefs are a critical component of analytical cognition and its effectiveness. Various measurement techniques are available to assess the level of epistemological beliefs and provide a consistent indication of a person's overall level of beliefs. Ample evidence shows that this is one attribute of cognition that can be changed and measured. Thus, a real potential exists that using epistemological beliefs to aid in the selection of personnel for analysis, and the training of such personal to improve their performance, will improve analytic cognition.

9.0 COGNITION

9.1 Introduction

Universal agreement exists that intelligence analysis is a cognitive process. However, despite the treatment of intelligence analysis as if it were something special, cognitively it isn't. Conceptually, differences between the cognition in intelligence analysis and that in many other intellectual activities are non-existent. It follows then that all research on cognition is potentially applicable to understanding the cognition of intelligence analysis.

Because of the universality of cognition to human activities an enormous amount of attention by philosophers and scientists has been focused on this topic. In general, these efforts fit into three categories:

- A study of the brain hierarchical structure and neural networks
- The processes of cognition such as sensemaking, mental models, and the divided mind
- Human cognitive behavior and the input/output of cognition

While all of these activities are adding to our understanding of cognition, the findings on behavior and input/output most readily translates into information that informs the act of intelligence analysis. What follows is an attempt to relate our findings on cognition to the practice of intelligence analysis.

9.2 Words as Concepts

Based on our analysis of research findings related to intelligence analysis, our intention is to develop and communicate concepts of the cognition of intelligence analysis and the foundation upon which this cognition rests. The immediate challenge is the means by which these concepts will be communicated: words. Many people have commented on difficulty of relating words to concepts.

> Socrates said, "Wisdom begins with the definition of terms."[46]
>
> "A vague idea is not clarified by giving it a name"[47]
>
> In the world of human thought ... the most fruitful concepts are those to which it is impossible to attach a well-defined meaning. —Hunter Lewis, *A Question of Values*
>
> "Names are codes; we should not let familiarity with them masquerade as understanding" [48]
>
> In as much as words do not have intrinsic meanings, the best we can aspire to is to discover the various connotations that have been given to the word, perhaps to see

88ABW-2013-5245; Cleared 12 December 2013

if usage reflects a high degree of consensus regarding what it should be taken to mean.[49]

Arguably, like most words familiar from common parlance, it is used uncritically, more often than not, with the tacit assumption that everybody knows what it means.[50]

All words begin as servants, eager to oblige and assume whatever functions may be assigned them, but, that accomplished, they become masters, imposing the will of their predefined intention and dominating the essence of human discourse. It is for this reason that articulate conversation must demand not only clarity of thought and expression but also preciseness of word choice and meaning.[51]

When we find a promising perspective, we do not merely appropriate it but, by making an imaginative interpretation of it, construe it to make it our own. The resulting perspective never will be exactly the same as that originally expressed by the other, just as the full range of meaning that we attach to words or concepts always will vary to some extent from the connotations attributed to the same words or concepts by others. [52]

We find it easy to fool ourselves into believing that something has been explained when it has really only been labeled or described, especially if the label sounds scientific or the description is given in technical terms. We can convince ourselves that we have made progress in our understanding of nature when, in fact, all we have done is substitute in our descriptions currently acceptable words for currently unacceptable ones.[53]

Words which stand for complicated concepts cannot be defined by a dictionary. Words like "Iiberalism" and “democracy" require the equivalent of scores of dictionaries, or scores of shelves of dictionaries. You cannot define those as you define "paper" and "ink." So with our own words that stand for complicated concepts - such as “evaluation," "indicator/' "capability," "estimates," and so on. As of today we use these words easily and often - yet one wonders if they are always understood in exactly the *way* intended. [54]

A word, therefore, can not only indicate a fact, but can also suggest an emotional attitude towards it. Such suggestion of an emotional attitude does go beyond mere factual description because our approvals and disapprovals are individual - they belong to ourselves and not to the objects we approve or disapprove of. An

> animal which to the mind of its master is a faithful and noble dog of mixed ancestry may be a 'mongrel' to his neighbour whose chickens are chased by it.[55]
>
> Thus an author can never literally transfer an idea. He can merely put down certain arbitrary symbols, which will serve to arouse a similar thought in his readers. How greatly the reader's thought differs from the author's it is difficult if not impossible to determine, for minds can only communicate by words. It is this difference in associated concept which often makes a reader fail to appreciate the profoundest thoughts of an author, and even, on the other hand, occasionally to see depth where it does not exist. [56]

The above is a sample of the commentary in the literature on the relationship between concepts and words. Agreement exists on the idea that words are not concepts but we have no other way to communicate concepts other than the use of words. Despite all of the cautionary commentary, the common practice of using a word without a precise definition to represent a concept persists. As a matter of practice we do not define our words in terms of the concepts represented and we assume that others have the same conceptual definition of the words as we do. The result is as predicted. Despite all external manifestation of agreement and understanding we cannot be confident that we have developed a common understanding of concepts.

The offset between words and concepts is particularly great in the literature on intelligence analysis and cognitive psychology. A variety of words are used in this literature to describe the act of input, modification, and output such as fact, data, information, knowledge, belief, hypothesis, evidence, assumptions judgment, opinion, and theories. However, a consistent or precise meaning of these words is not used in the intelligence literature, sometimes even by the same author. In many cases the words are used as if they were synonyms of one another. The net result is a lack of conceptual clarity as to what is postulated about the act of cognition or the conduct of intelligence analysis.

The issue of words and concepts is particularly acute to our endeavor. We present concepts about cognition that differ from others but the words we use to describe these concepts are similar to words used by others. The conceptual differences only become apparent by recognition of the different meanings attributed to the same words. To alleviate this problem the following is the relationship of words and concepts used in our description of cognition. We are not asking you to agree with our definition of the relationship but we are asking you to use our definition as you assess our conceptual description of cognition. Otherwise our description loses all meaning if other relationships are used.

- Information – content that is received by one's senses. An umbrella description of all and any content of the input to the cognitive function. Content can include fact, data, and output from cognitive functioning of others such as belief, opinions, or judgments.
- Fact – identical results from repeated measurements of the characteristics of various objects, behavior, or phenomena. For example, the characteristics of gravity, speed of light and atomic weights are all facts. A distinctive feature of a fact is that it has

[55] Thouless, R.H. *Straight and Crooked Thinking,* Pan Books Ltd., London, UK, 1953, p. 5.
[56] Hazlitt, H. *Thinking as a Science,* E. P. Dutton & Co., New York, NY, 1916, p. 202.

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

a value or meaning which involves little or no human interpretation. Therefore, the meaning of facts does not vary between individuals. Also, facts are not time dependent. The same measurement results are obtained whatever the time interval between measurements exists. Comparatively, there are few facts. Contrary to many assertions, facts do speak for themselves. Common usage is the phrase "the facts are." In almost all incidents the statement does not relate to facts but rather to what the individual considers indisputable data.

- Data - results of measurement that are likely to change when the condition of measurement changes. Examples include the population of the U.S., the Dow Jones index, polling results, and the IQ of a group. The assertion that data do not speak for themselves is correct. As mentioned above, the oft-used phrase "the facts are" is more accurately expressed as "the data are."
- Known – The content of the memory of an individual. Part of what is known is identical to the information received; the content has not been changed by cognition of the individual. The other part of what is known is the result of internal thought and thinking. An individual does not know what they know. What they know is not the same as the content that they can consciously retrieve.
- Belief – An explanation of phenomena, events, or occurrence in life that an individual holds to be true. The existence of a belief or the degree it is considered true is independent of the amount of supporting evidence held by the individual.
- Knowledge – What is known.
- Evidence – Information to which a meaning has been assigned that supports or negates a belief. All information is evidence of some belief. The same information can have many meanings, so it can be evidence for many beliefs.
- Assumption – statements, descriptions, or explanation that are treated as if they were true; a provisional belief to be used in cognition.
- Hypothesis – a tentative explanation of phenomena, events, or occurrences; a conditional belief for the purpose of marshaling supporting evidence. If the evidence convinces one that the hypothesis is true, it is no longer a hypothesis but a belief.
- Opinion/Judgment – an external expression of a belief or combinations of beliefs.
- Theory - a belief or collection of beliefs that are held to be true by a substantial number of individuals.
- Cognition – a global word for all functioning of the mind.
- Thinking – A specific form of cognition. A goal directed activity based on what is known to create explanations. [57]
- Inner speech – A conversation with yourself that does not involve external vocalization.

[57] Holyoak, K.J. & Morrison, R.G. "Thinking and Reasoning: A Reader's Guide," in *Oxford Handbook of Thinking and Reasoning*, eds. K.J. Holyoak & R.G. Morrison, Oxford University Press, Oxford, UK, 2012, p. 1.

Distribution A: Approved for public release; distribution unlimited;
88ABW-2013-5245; Cleared 12 December 2013

- Thought – The content of inner speech
- Consciousness – Cognitive activity using inner speech
- Unconsciousness- Cognitive activity without the use of inner speech

Since at this stage you are not aware of the concepts that are driving these definitions, we do not necessarily expect agreement. If you are unable, as expected, to adopt these definitions, we ask that you use them as assumptions, as defined above.

9.3 Cognitive Behavior

9.3.1. Individual Need for Explanations

Whether one calls it sensemaking, mental models, mindsets, frames, or schemata, humans have an unrelenting need to develop beliefs about everything with which they interact. This need is the underlying motivation for cognitive activity.

> The human brain is a compulsive explainer. It's constantly churning out hypotheses based on current observations, prior experiences, and existing beliefs. It does that automatically, effortlessly. And quickly. [58]
>
> It isn't that we humans like to have explanations for things; we must have explanations. We are an explaining species. Explanations, by making sense of an uncertain world, apparently render the circumstances of life more predictable and thus diminish our anxieties about what the future may hold. Although these explanations have not always been valid, they have enabled us through the millennia to cope with a dangerous world and to survive as a species. The compulsion to explain everything drives our curiosity and thirst for knowledge of the world.[59]
>
> Why should we care a whit whether black holes really exist, or whether neutrinos have mass, or what makes pulsars pulse? Whatever the answer to why we care about such things there can be no question that we do care. Many of the best minds the species has produced have devoted themselves to trying to extend our understanding of the universe in which we find ourselves, arguably for no more compelling reason than that of extending our understanding of the universe in which we find ourselves. The urge itself is remarkable, but so, as Davies and others have noted, is the apparent ability to ask and answer questions that have little direct relevance to our survival as individuals or as a species. [60]
>
> Himsworth (1986) attributes this need for explanations to fear of the unknown: "Fear of the unknown is deeply ingrained in human beings. In consequence, faced by anything they do not understand, they cannot rest until they have given themselves an explanation of it" (p. 94). Whether or not fear is the motivating factor, we are explanation-generating entities.[61]

But we will have explanations. It is our nature to wish to know both how things are and why they are that way. The instrumental value of the kind of knowledge that many explanations represent is unquestionably great, but our desire for explanations is not limited to those that have obvious practical utility; we wish to understand for the sake of understanding, and this, in my view, is as much of a defining property of a rational being as we are likely to find.[62]

I find it easy to see explanation as a key aspect of rationality, and believe the continual search for explanations to be a defining characteristic of human nature. Explanations provide one with a sense of closure, the resolution of uncertainty, sometimes answers to vexing questions. They can facilitate thinking by permitting it to move on, as when the resolution of a specific question provides the basis for making headway on perhaps more interesting or more general ones. [63]

Man differs from animals in that he has a reasoning mind, and this mind...cannot tolerate a vacuum, it finds an explanation for everything.[64]

For at least a century, psychologists and philosophers have suggested that our urge to explain the world is analogous to our urge to populate it. Like making babies, they argue, making theories is so crucial to our survival that we have a natural drive to do so - what William James called a "theoretic instinct."[65]

Reasoning with causal information clearly is an important aspect of reasoning about evidence. Basically, it can take two forms. Using familiar AI terminology, in prediction, one observes or assumes a certain event and tries to predict what will happen as a consequence of this event, while in explanation, one observes an event or state of affairs and tries to explain how it could have been caused by other events. Both forms of reasoning are, of course, of prime importance in reasoning about evidence, whether story or argument based[66]

We define sensemaking as the deliberate effort to understand events. It is typically triggered by unexpected changes or other surprises that make us doubt our prior understanding. We also describe how these sensemaking activities can result in a faulty account of events.[67]

The domain practitioner's higher purpose is not to perceive stimuli, but is, simply put, *to make sense of things*.[68]

9.3.2. Individual Need for Certainty

By definition, an explanation does not necessarily have the attribute of being true. An explanation can be tentative, such as a hypothesis, or can be believed to be true and has become a belief. However, just as humans have a need for explanation, they also have the need to believe that their explanations are true.

> The certainty they exploit is the certainty - or the longing for it - already present inside each of us.[69]

> It seems to be a common defect of human minds that they tend to crave for complete certainty of belief or disbelief in anything. Not only is this undesirable scientifically, but it must be recognized that no such state is obtainable in science. However successful and reliable a theory may be up to any point of time, further data may come along and show a need for adjustment of the theory, while at the other extreme, however little confidence one has in a hypothesis, new data may change the situation.[70]
>
> The quest for truth, it seems to me, is one thing - possibly the only thing - that different traditions of rationality have in common. We may not all agree on what the truth is, but the assumption that we are all seeking it is what gives us reason to hope that progress - that can be recognized as progress by all - can be made. [71]
>
> It seems more than remotely possible that our intolerance of uncertainty and the assumption that we appear to make that every event has an identifiable cause may contribute to overly simplistic cause-effect views of phenomena in general and of human behavior in particular.[72]

9.3.3. Input to Thinking

As we pointed out earlier, the cognitive behavior of an individual is motivated by a need for justifying certain explanations. These explanations are the result of thinking that is based on what one knows and the purpose of thinking. While information as received can be incorporated into memory, the as-received information is insufficient for use in developing an explanation. The thinker must interpret information and assign a meaning to it.

> There is a widespread myth that information is something in the world that does not depend on the point of view of the observers and that it is (or is often) independent of the context in which it occurs.[73]

As pointed out by many, the assignment of meaning to any piece of information is highly individualized.

> One of the oldest and most reliable generalizations in psychology is that perception is not merely the passive receipt of information but is instead a process of active interpretation, selective attention, deduction, and inference. The "facts" never "speak for themselves."[74]
>
> There are no facts of fixed significance. … A particular datum gains significance or meaning only from its relationship to the context in which it occurs or could occur including the perspective of observers. As a result, informativeness is not a property of the data field alone, but is a relationship between observers and the data field.[75]
>
> There is no such thing as a definite piece of indisputable knowledge about the world whose meaning is not in some way colored by preexisting belief about the world.[76]
>
> …information cannot speak for itself. The significance of information is always a joint function of the nature of the information and the context in which it is interpreted. The context is provided by the analyst in the form of a set of assumptions and expectations concerning human and organizational behavior. These preconceptions are critical determinants of which information is considered relevant and how it is interpreted.[77]
>
> Information does in this view not include any inherent level of validity, truth or certainty in order to qualify as information . Quite on the contrary, information is the propositional content towards which an agent actively can entertain different attitudes. Hence, of significance are the propositional attitude of the agent, the processes and methods of justifying the different attitudes. [78]
>
> But evidence must be interpreted; and it is probably very infrequently the case that the evidence on any complex issue admits of only one interpretation or is overwhelmingly indicative of only one answer. What is made of any bit of evidence - indeed the extent to which any bit of data can function as evidence - must depend, to no small degree, on what else the one who interprets it already knows or believes.[79]

The source of this variability is described below.

> Most of this resonates well with the postmodern view that no determination of a single truth is possible. The complexity sciences confirm that the observer and the observed cannot be detached from each other …. This is supported by the postmodernist

understanding that no matter how we assess information, knowledge or intelligence, we can never achieve anything other than a mirror of how we see the 'facts. [80]

Conflicting representations of the same event come to be understood as legitimate products of individuals' unique meaning-making efforts because interpretive mental processes vary across individuals, their products may also differ. It is at this point that the multiplist level of epistemological understanding begins to take hold: Perhaps all knowing is only opinion.[81]

Of more direct concern to the present chapter is the finding that content and context profoundly affects reasoning even when logical structure is held constant. So pervasive are the effects of prior knowledge and belief on reasoning, that Stanovich (1999) has recently described the tendency to contextualize all information given as the fundamental computational bias in human cognition. [82]

Behavior that is irrational for one person may be rational from the perspective of another whose knowledge, beliefs or values differ. [83]

The fact that the same observational evidence can be extrapolated to give two diametrically opposite predictions according to which explanation one adopts, and cannot justify either of them, is not some accidental limitation of the farmyard environment: it is true of all observational evidence under all circumstances. [84]

The fact that top-down knowledge affects interpretation means (among other things) that two people with the same information - be it a low-resolution satellite photograph or the incomplete facts surrounding a death - can logically interpret it differently given different prior knowledge. [85]

9.3.4. Judgment of Thinking

Because of the acknowledged variance in assignment of meaning between individuals, the difficulty in judging the validity of the thinking of an individual has been acknowledged by many.

Wherever we look, we see indications of the wisdom of Polya's (1954b) admonition to not neglect the obvious fact that two people presented with the same evidence may honestly disagree.[86]

When A reads something that B has written, A's task is to understand not what B says, but what B means. The task is complicated by the fact that B himself may not understand

clearly what he means. It is easy to imagine conversations between two parties in which one participant claims, in all sincerity, to understand what the other has said but really does not. [87]

In the Agency, and in other intelligence agencies, only ‘‘one organizational view’’ of an issue can prevail. Such conformity defies both human nature and logic. Within any organization, individual analysts frequently reach different judgments about the quality of information, the correct interpretation of data, and the likely implications of any foreign development.[88]

Hannes Alven (1988) provides a particularly interesting illustration, not only that experts in the same problem area can interpret the same evidence differently from each other, but that they can each interpret the evidence in different ways at different times.[89]

Thus even if we were willing to assume that two individuals had precisely the same knowledge with respect to some issue, we should not find it difficult to believe that they could come to different conclusions about the issue.[90]

Also, it is doubtful that, in complicated situations, two individuals ever have precisely the same evidence with which to work. If there is a large amount of information that is germane to the issue, chances are that different individuals will have acquired different aspects of that information at different times under different conditions and to different degrees, so that their knowledge, as it relates to the issue at any given time, is unlikely to be exactly the same.[91]

Finally, it must be acknowledged that justification is a very subjective matter. What I consider to be strong justification of a particular belief, you may see as inadequate; and I may fail to see the merit in the argument you advance in support of a belief that you hold and I do not. [92]

It is much easier to think that other people are biased or closed-minded than to understand that if everyone else sees the world through his own construction of it, then you yourself must be doing the same. What beliefs and assumptions do you bring to your consideration of the issues?[93]

Our earlier knowledge structure influence the way we receive and understand new information. The same piece of information is consequently received differently dependent on the person's pre-understanding of the topic.[94]

> On one pole has been the view that only propositions verified by observed phenomena should be called knowledge. On the other pole has been the view that the world is always interpreted through different lenses of concepts and beliefs, and that there exists no independent criterion for deciding if one lens is more valid than another.[95]
>
> We do know that when a case is tried twice, as is possible in most civil law systems, different courts may reach different decisions in the same case and on the same evidence. It is not always clear what the origins of such disagreements are, but they definitely do not support the basic belief that the reasoning power of human beings will always lead to the one and only correct verdict[96]

9.3.5. Ramifications

The body of thought represented by the sampling of writings above lead to three conclusions

- Information does not have a single value of meaning. Information's value and meaning depend on the knowledge of the individual making the assignment plus the purpose that motivate the assignment.
- Differences in assignment of meaning can occur between individuals and even within a single individual as changes occur in what they know or believe, or changes in purpose.
- When the output of an individual's thinking is based on their assignment of meaning, the judgment of the validity of such thinking by another individual requires knowing what the other individual knows.

These conclusions seem to directly follow from the cited writing and as such are uncontroversial, but they are controversial when contrasted with common practice in research on cognition. Much of this research consists of measuring and comparing the output of the test subject to what the researchers believe is the correct answer. The subject is considered objective and rational when the cognitive output agrees with the output expected by the researcher.

Most research on thinking biases are so structured. One illustration is the so called confirmation bias. The normal mode for most individuals is to evaluate new information relative to their existing beliefs. As a result, the thinking purpose is not to answer the question of what does newly received information mean but rather it is to answer the question of whether the information supports an existing explanation. It is a common response that if the information does not support an existing explanation, the receiver of the information ceases to think about it.

The rejection of information that conflicts with existing beliefs is treated as if it is a flaw in thinking. However, such thinking is not flawed but rational in the context of the individual and the purpose of their thinking.

This example underscores what is apparent in the above comments on meaning. The thoughts and resultant thinking is the product of an individual. The results are likely to be as varied as the variability of knowledge, beliefs, and goals between individuals. One might disagree with the results of another individual's thinking, but that does not mean the thinking was any less rational than that used by the disagreeing party.

Despite all that has been written on natural differences in interpretation of information, the normal mode of interaction between individuals is to judge such differences. One only has to read the commentary on the internet to see the acrimonious attacks on others who have a differing opinion. The situation is not different when so-called experts are involved in such disagreements. Disagreements in scientific literature are legion. The participants are exhibiting individualized anthropocentrism, that is, a steadfast adherence to the belief that their interpretation is the correct one.

Also in contradiction to what has been written, the premise that information can be explained by a "single correct answer" is central to the quality assurance practices of many organizations involved in the interpretation of information.

> In the Agency, and in other intelligence agencies, only ''one organizational view'' of an issue can prevail. Such conformity defies both human nature and logic. Within any organization, individual analysts frequently reach different judgments about the quality of information, the correct interpretation of data, and the likely implications of any foreign development.[97]

One well known example of this condition was the claims made during his confirmation hearings by his subordinates that Gates politicized intelligence on the Soviet Union. An alternate explanation is that Gates had a more negative view of the motives and goals of the Soviet Union than his subordinates so he interpreted their actions as more threatening. In this case neither group at that time was correct since they didn't anticipate the breakup of the Soviet Union.

This example also illustrates a characteristic common to most instances of evaluating interpretation after the fact: a focus on the end product rather than the cognitive process used to arrive at the content of the end product. An alternate basis for judging the merits of the thinking can be gained by an examination of the process: How exhaustively was information acquired, the reasoning used in assigning meaning, and the amount of evidence supporting the explanation? The use of process evaluation does not resolve, however, the issue of judging which answer is "correct" since different results can be achieved by two equally thorough processes

Does one conclude that there are no "right" answers and, as stated above, "Is all knowing just a matter of opinion?" For answers that are based on human interpretation, yes, they are all opinions, some of which may be proven correct by subsequent events. However, not all opinions are of equal merit.

> One can therefore understand our ideological prisms as a kind of human shelter – the result of our individual experiences and collective histories. These prisms make it inherently difficult to believe that anyone who actually thinks truly can arrive at conclusions that differ from our own. Corroboration leading one person to believe in a hypothesis does not necessarily mean that another person believing in the hypothesis based on the same corroborative reason actually perceives the conclusion of the hypothesis the same way as we do. In other words, two people can believe the same hypothesis, but they can believe it differently, which entails that critical rationalism only ensures self-corrective criticisms of the thought process, and not self-criticism of our perception of the conclusion. [98]

The idea that one should strive for self-corrective criticism of the thought process rather than self-criticism of the conclusion is a foundation for a quality assurance program that is consistent with all of the research cited above. A wealth of literature exists on conceptual change, persuasion, and changing the mind of others, but is not directly applicable to the desired quality assurance program. The overall thrust of this literature is how to get people to change their opinions and adapt yours. This is contrary to the idea of judging the merit of an opinion based on the process used to form the opinion. However, a limited amount of research suggests that an act of self-corrective criticism of the process can lead to a self-corrective change in the conclusions. These processes are not to be confused with such structural analytic techniques as devil's advocacy, Team A/Team B or Red Team Analysis since these techniques involved comparison of results rather than processes.

The FAC provides the procedures and process of the entire analysis process from formulating the intelligence issue to be answered to the representation of the answer. In addition, the use of FAC results in all the information needed for a quality assurance program for the practice of intelligence analysis.

10.0 FRAMEWORK FOR ANALYTIC COGNITION

The preparation of a handbook that encompasses the entire analysis process, which became known as the *Framework for Analytic Cognition (FAC)*, began in 2008. Two and a half years later we completed the FAC and published it in its entirety. We wrote each section, which represented a segment of the analysis process, in the same sequence as the topics occur in the analysis process. We made few modifications to prior sections as we completed subsequent sections of the FAC.

As we mention in the FAC itself, at the completion of analysis one is cognitively a different person than the one that embarked on the analysis effort. This is equally true for us at the completion of the writing of the FAC. In addition, we gained much more knowledge from our research synthesis of findings in scientific areas applicable to analysis. Thus, we recognize that the FAC can be improved, not to change its basic content but to provide more evidence supporting the practices we recommend. We could also improve the communication of the ideas embedded in the FAC.

Unfortunately, when work on the contract was suspended, we were not able to accomplish the updates and expansions that would improve the FAC. We were able, however, to create two condensed versions of the FAC designed to stimulate interest in its use:

- *Framework for Analytic Cognition (FAC): Essential Elements of the Intelligence Analysis Process* is approximately 14 pages long and provides, for each of the eight components of the FAC, a brief discussion of the purpose of the component, the benefits it provides to the intelligence analyst, a concise description of the activities needed to accomplish the goals of the component, and a review of the output of those activities.
- *Master the Cognitive Challenges of Intelligence Analysis Using the Framework for Analytic Cognition (FAC)* is approximately 80 pages long and contains highlights of the eight components that make up the FAC. For each component we provide an introduction, a review of the steps needed to accomplish the task, tips, a checklist, and a description of the outcome of each component of the FAC. Some components also have supplemental worksheets or questionnaires to help readers with the tasks described in that component.

These documents can be used as an introduction to the full FAC or as quick reference guides for use after learning the full FAC. Both of these publications were designed to communicate that the FAC is oriented to helping the individual intelligence analyst by providing concrete, practical assistance for doing a complex and essential job. In addition, we hoped to demonstrate that the FAC is systematic, but flexible enough to accommodate the way analysts think and the unstructured and highly iterative nature of intelligence analysis.

11.0 RECOMMENDATIONS

11.1 Quality Assurance

Develop a quality assurance approach. The basic concepts to be used are cooperation rather than challenge with the focus on the execution of the process for formulating an analytical conclusion rather than the content of the conclusion. The review should occur at the end of each stage of the analysis process rather than at the end of process. This will result in early detection and correction of execution issues. This approach will not necessarily result in single answer to an intelligence issue but will provide the information and interpretation resulting in different answers. FAC provides the structure of this quality assurance program.

11.2 Analysis Selection

Assessments for thinking dispositions and epistemological beliefs should be added to existing criteria for the selection of personnel for the intelligence analysis function. A variety of validated assessment tools exist that can measure the characteristics of a person's thinking dispositions and epistemological beliefs.

11.3 Analyst Training

If the performance of an analyst is to be measured based on the execution of the analysis process, then the analyst has to be trained on how to execute. We recommend that a training course based on the FAC be developed. This course would include using the procedures taught for performing the complete analysis process. The approach to training would incorporate procedures and exercises designed to accommodate context sensitivity. Accordingly, an essential ingredient of the training would be a standard repertoire of intelligence problems and databases tailored to the students' specialties. The course would provide a solution for each problem that represents the best analysis that can be accomplished given the information in the databases. Course facilitators would use these solutions to evaluate each student's analysis. Each student would also be able to compare his or her results with what an expert has accomplished.

In addition, a training course to improve the thinking dispositions and epistemological beliefs of analysts should be established. Various techniques for such training already exist and should be incorporated into the professional development activities of intelligence analysts.

11.4 FAC Enhancement

Our efforts to survey the scientific literature for useful additions to the practice of intelligence analysis validate our original problem statement. However, we have not covered the available literature exhaustively so the potential that more information exists that can improve the analytical process is still large. Research synthesis of relevant topics should continue so a more complete understanding of cognition during analysis is acquired. The goal of such syntheses would be modifications of analytic practice that both facilitates the adoption of new techniques and information by analysts and the improvement of cognitive results.

Acknowledgments

We are grateful to the Office of Community Oriented Policing Services (COPS Office) for commissioning this manual, which is intended to be a companion volume to our earlier publication, *Crime Analysis for Problem Solvers: In 60 Small Steps*, which was also commissioned and published by the COPS Office. We thank our many colleagues and friends on whose work we have drawn. Special thanks are due to those who supplied material for inclusion: Christopher Bruce (Step 41), Mangai Natarajan (Step 20), Jerry Ratcliffe (Step 4), and Rashi Shuhkla (Step 43). Daryn Beauchesne, Leonard Miranda, Kristen Miggins, Andy Mills, Nanci Plouffe, Karin Schmerler, John Stedman, and Julie Wartell took part in a meeting, graciously hosted by the Chula Vista Police Department, to discuss our plans for the manual. Finally, we are grateful to Christopher Bruce and Andy Mills for their detailed commentary on the first draft of the manual.

Read This First

The 9/11 Commission famously criticized the country's intelligence agencies for failing to "connect the dots" before the attack—that is, for failing to detect a pattern in the scattered items of information about the hijackers that had come to the attention of various federal and state agencies. The resulting calls for intelligence reform were at first confined to the nation's security agencies, the FBI and the CIA. Soon police leaders began to argue that their agencies, too, had a vital role in addressing terrorism and that they must be included in the loop.

Terrorism may have raised the profile of police intelligence, but it is not the main reason for improving its use. Police intelligence has a far wider role in public safety, crime reduction, and order maintenance. This wider role is explored throughout this manual. Unfortunately, the word "intelligence" also raises public fears that secretly collected police information will be used to subvert individual liberties and democratic institutions. We will touch on these concerns later; here, we should explain why we wrote the manual, who it is for, and what it covers.

What is this manual about and who is it for?

As we discuss in Step 1, intelligence analysis is "a process for making sense of a diverse array of information about crime problems created by offender groups, with the goal of reducing crime." Numerous books and manuals for crime analysts are available that describe how to process data to guide police anti-crime tactics and strategies. In contrast, most writing on police intelligence focuses on data gathering and sharing, administration, and legal requirements. These are all important topics, but they do not help the analyst **analyze**, i.e., make sense of the data in order to glimpse behind the veil of a criminal enterprise.

Our manual fills this gap by providing a practical guide to intelligence analysis, much like our earlier manual on crime analysis written for the Center for Problem-Oriented Policing. In writing this manual, it soon became clear that police intelligence has a much larger mission than simply finding out who is up to no good, who they hang out with, what they are about to do, and where they can be found. These are the sorts of questions we normally expect police intelligence to address. However, there are other questions that intelligence analysis can effectively address, such as: How do offenders commit their crimes? What circumstances help them commit their crimes? And, what countermeasures might prevent them from doing so? In short, we look beyond the "who" to address "how," "when," "where," and "what."

This manual fuses aspects of intelligence analysis with Problem-Oriented Policing**.** The links between the two have been ignored in the past, with the exception of Jerry Ratcliffe's book referenced below. However, knowing how intelligence analysis can help solve problems and how problem solving can improve the effectiveness of intelligence analysis will aid any police practitioner interested in reducing crime or disorder.

This manual is not intended to serve the entire law enforcement community. Nor does it describe all facets of intelligence. Rather it focuses on the **analysis** of intelligence, and we wrote it for three groups in local policing agencies: (1) intelligence officers and analysts, (2) crime analysts who might need to use intelligence information and, (3) police managers who supervise crime and intelligence analysts. If you are such a manager, and you find that the work of analysts is something of a mystery, then we hope this manual can demystify their work and help you make better use of your analysts.

The coverage of this manual

The central focus of this manual is the analysis of data: making sense of the variety of bits of information describing criminal groups or problem gatherings. This manual does not cover:

- Federal, state, and local intelligence organizations, groups, and networks
- How to set up or manage an intelligence unit within a police organization
- All the sources of data and information available
- Security requirements for those with access to intelligence data
- Legal requirements for obtaining and sharing intelligence information

There are other documents, books, and resources that cover these topics.

Three key assumptions

1. In preparing to write this manual, it quickly became apparent that (1) there is considerable overlap in the analytic techniques employed and the skills needed by intelligence analysts and crime analysts and, (2) most police agencies would have insufficient resources to employ separate groups of both specialists. We have therefore assumed that intelligence analysis and crime analysis are broadly similar and will generally be undertaken by the same group of analysts.
2. In our early discussions with crime and intelligence analysts, they were able to identify only one important difference between their roles: That intelligence analysis focuses mainly on criminal groups and problem gatherings. Examples of the former would be terrorists, street gangs, outlaw motorcycle gangs, and organized shoplifters, and of the latter would be illegal street races, political demonstrations by extremist groups, and student crowds at spring break. Consequently, this manual focuses on analyzing information about criminal groups and problem gatherings.
3. The third assumption derives from our backgrounds in community policing and problem-oriented policing. The purpose of intelligence analysis should be to find ways of altering the "facilitating conditions" that permit these groups and gatherings to create harm. In other words, intelligence analysis can contribute both to long-term and immediate reductions in crime.

How is the manual organized?

The first part of the manual consists of 30 "Steps" organized under six sections. Each step covers a discrete topic and each one stands on its own. So there is no need to read the manual straight through from beginning to end; you can dip into it at any point. Nevertheless, topics do connect with each other and follow a logical order. Where these connections are vital, we reference other steps. At the end of most steps, we include some references to written materials that give more details about the topic.

The second part of the manual contains case studies of various criminal groups and problem gatherings that we undertook in order to assist our thinking about the uses of intelligence analysis. These case studies provide useful examples of the kinds of information that might be collected and ways in which it might be used.

Policing agencies and law enforcement

- Throughout this manual, we use the term "police agencies" to refer to agencies of local government whose primary business is policing. As well as municipal and town agencies, this includes sheriff agencies that provide police services to county residents and businesses, but not those that only provide correctional, warrant, or court services. We do not include federal agencies, such as the Federal Bureau of Investigation (FBI), Drug Enforcement Administration (DEA), and Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF).
- We use the term "law enforcement" to refer to a procedure or tactic that police agencies can use, but we do not use the term "law enforcement agency" because law enforcement is only one of many tools police can use. Intelligence analysis should help police decision makers choose among the available tools.

Part 1

Intelligence Analysis for Solving Problems

01 KNOW WHAT INTELLIGENCE ANALYSIS COMPRISES

TERRORIST THREATS HAVE DRAWN ATTENTION TO THE VITAL ROLE OF INTELLIGENCE. However, the threats have also promoted inflated expectations and confusion regarding this role. This is particularly true in local policing. One source of confusion is that "intelligence" is used to refer both to raw information collected from some source and to the result of systematically analyzing this information. Many writings on intelligence analysis do little to clarify the term because they provide limited guidance as to what actions comprise analysis and the purposes these actions are supposed to serve.

National intelligence and criminal intelligence

While there are substantial differences between national intelligence (as conducted by federal agencies involved in international affairs) and criminal intelligence, we found Robert Clark's book (referenced below) on national intelligence helpful in defining the scope and objectives of police intelligence analysis. Clark asserts that intelligence analysis has five characteristics: orientation, target, goals, inputs, and methods. For policing, the first three characteristics are far more important and we discuss orientation, targets, and goals below.

Orientation – proactive

Intelligence analysis has a future orientation. It tries to determine what criminal activity is likely to happen if police do nothing to prevent it. In short, intelligence analysis is proactive. Consequently, reactive uses of information, such as to solve crimes that have already occurred, are not generally included in intelligence analysis. Solving crimes helps to redress past events, and though vital, this is not designed principally to prevent future incidents. Investigative information can be converted to intelligence when it is analyzed for the purpose of preventing future crimes.

Targets – groups

Intelligence analysis is directed against offenders operating in groups. Groups may facilitate offending, thus making them more serious than individual offenders acting alone. More importantly, intelligence can exploit the special vulnerabilities of groups, which are as follows:

- **Keeping Secrets.** Benjamin Franklin said, "Three can keep a secret if two are dead." While this is rather extreme, it illustrates an important point: the more people who need to keep a secret, the less likely it is that the secret will be kept. This is why criminal groups often enforce secrecy with threats, and perhaps it is also the reason the Hell's Angels quote Benjamin Franklin. But, offender groups are not necessarily good at keeping their members compliant.
- **Visibility.** A related vulnerability is that the larger the group of offenders, the greater the difficulty of keeping a low profile. The danger is especially great when group members gather. Establishing secret meeting places helps them overcome this difficulty. But establishing such a place often requires group members to work with non-offenders (e.g., landlords) and this also increases their risk of detection. Groups that ostentatiously promote themselves create more information that intelligence analysis can exploit.
- **Coordination**. Unlike individual offenders operating alone, groups of offenders have to coordinate their activities with one another. Coordination difficulties rise as the group increases in size. Consequently, while groups have greater capacities than individuals, they are also less flexible, which, at least in the short run, makes them more predictable. In the long run, groups may have a greater chance to innovate than individuals, but this takes time.

In short, groups leak information that can be gathered and analyzed and, as we note below, the variety of information sources makes analysis mandatory.

Goal – prevention

The fundamental purpose of intelligence analysis is to prevent group crimes from occurring. This is consistent with the first two elements: a future orientation and

group offending. Intelligence analysis targets groups in order to reduce crime. To serve this purpose, the detection, arrest, and prosecution of group offenders are important, but intelligence analysis is not limited to these actions. Going beyond law enforcement is critical to achieving crime reduction goals. Consistent with community and problem-oriented policing strategies, intelligence analysis can serve a wide range of preventive activities. In subsequent steps, we describe how intelligence analysis can expand the range of prevention activities by applying principles derived from environmental criminology.

Inputs – many

Intelligence analysis uses information from a wide variety of sources. It is not restricted to covert sources. Standard police records, available to the public, and other data collected by private and public agencies are often extremely useful. We examine some of the most obvious sources in this manual, but the sources available are only limited by imagination, resources, and technology. If intelligence analysis were restricted to a single source, the need for analysis would be much reduced. It is the need to make sense of multiple information sources, including data from other jurisdictions (see Step 22), each with its own strengths and weaknesses, that makes analysis important. Consequently, we do not define intelligence analysis by the type of information used: variety is what is important.

Methods – varied

Intelligence analysis methods involve processes to sort, interpret, and compare information from multiple sources in order to determine what offending groups are likely to be operating, how they commit crimes, and what can be done to keep these groups from being successful. Just as there are many sources of information, police can use many analytical methods. We will discuss some of the most important. We do not define intelligence analysis by the use of any particular method; any systematic approach that helps provide an accurate assessment can be part of intelligence analysis.

Lone wolves

What about the threat of "lone wolf" terrorists? Are their actions not susceptible to intelligence analysis? Practically speaking, no. Although the harm they can do is extreme, this does not mean that intelligence analysis can do any more for the lone wolf terrorist than it could do for the lone wolf bank robber, the isolated drug dealer, or the stand alone fraudster. If individual offending creates patterns, crime analysis can help. Controlling access to explosive materials, for example, helps thwart isolated terrorists as well as organized ones. However, without a group or a pattern of behavior, police have to rely on isolated and unpredictable reports of community members, chance encounters, and investigative work. This might happen when lone wolves "reach out" to others for assistance (e.g., obtaining weapons, information, or other support). When they mistakenly reach out to individuals with connections to police, this presents the police with an opportunity to identify and remove them.

In summary, *intelligence analysis is just a specialized form of crime analysis that focuses on problems created by groups of offenders*. It is a process for making sense of a diverse array of information about crime problems created by offender groups, with the goal of reducing crime. Intelligence is just a form of information that describes groups. Sources and methods do not define it.

Robert M. Clark. 2007. *Intelligence Analysis: A Target-Centric Approach.* 2nd Edition. Washington, D.C.: CQ Press.

02 KNOW THAT INTELLIGENCE ANALYSIS MUST LOOK BEYOND ENFORCEMENT

WE HAVE SAID THE GOAL OF INTELLIGENCE ANALYSIS IS TO REDUCE THE PROBLEMS CREATED BY OFFENDER GROUPS. Gathering, analyzing, and sharing data might assist in making arrests and prosecutions and could result in breaking up a group. However, this can only be considered effective action if the problems created by the group decline.

For example, breaking up a group that steals catalytic converters may not be productive, under the following circumstances:

1. The group was never responsible for an important proportion of the problem
2. The wrong members of the group are removed
3. Those arrested are quickly replaced by others, thus reestablishing the group
4. Other groups move in to take advantage of the now vacant opportunity

Unless there is a reduction of theft of catalytic converters, the actions were not effective. To ensure that they are effective, intelligence analysis should focus on the complete problem. In our example, the analysis should examine the catalytic converter theft process from beginning to end—from the characteristics of vehicles and victims to the reentry of the stolen converters into the legitimate market. In short, the problem is not the group stealing the catalytic converters, but the entire theft process, of which the group is an integral part.

These points can be illustrated by police attempts to disrupt street drug dealing, particularly in the late 1980s through the early 1990s when police targeted the most highly visible drug groups. Unfortunately, the most visible were not necessarily the most active in dealing or the most violent. In addition, informants sometimes directed police operations to serve their own needs; a difficulty that is made worse when there is little or no effort to gather systematic information on the problem so the informant's data can be evaluated in a larger context. Even when the group was a major contributor to the problem, the enforcement sometimes focused on those most easily replaced—retail dealers. Such easily replaced individuals are not critical to the functioning of the organizations.

Several randomized experiments conducted in the 1990s show the difference between an enforcement approach and an intelligence, problem-focused approach. (All these studies are reviewed in the National Research Council book referred to below.) First, let us consider Sherman and Rogan's experiment to determine the effectiveness of crack house raids in Kansas City. Possible raid targets were randomly allocated to receiving a raid and not receiving a raid. Though some crime reductions were observed at the raided houses relative to the other houses, these reductions were relatively minor.

Now, consider another experiment designed to look at the effectiveness of going beyond enforcement. In San Diego, Eck and Wartell looked at what happens if, after a raid, the landlord was compelled to improve apartment management practices. Raided addresses were randomly assigned to three groups: those that received no further treatment (control group); addresses where police sent the landlord a letter describing the raid and offering assistance (letter group); and addresses where police compelled the landlord to meet with narcotics detectives and city code inspectors and form a plan to improve the property (meeting group). All places had less drug dealing after the raid than before, but the meeting group places had a 60 percent reduction in crime relative to the control group (the letter group had outcomes between the control and meeting groups).

Finally, let us consider another drug experiment comparing problem-solving efforts at drug hot spots with enforcement crackdowns. Weisburd and Green randomly assigned street drug markets hot spots in Jersey City to either of these conditions. The problem solving approach showed far greater reductions in drug dealing and other forms of disorder than the standard enforcement approach.

These and other studies point to a consistent picture of the kinds of police strategies that work to reduce crime. In 2004, a National Research Council report described four policing strategies and their relative effectiveness (see Figure 1). The more focused the strategy and the wider array of tactics used, the more effective the strategy. In the lower left of Figure 1, the standard model of policing (relying predominately on random patrol, follow-up investigations, and rapid response) is the least effective strategy. It does not focus on specific places, people, or times and uses a predominately law enforcement approach.

Somewhat more effective is community policing (in the absence of problem solving). Community policing gains effectiveness by adding considerably more tactics, but it is still relatively unfocused. Focused policing, on the lower right in Figure 1, is far more effective than standard policing, because it narrows policing efforts to "hot" people, places, or times. Instead of spreading resources thinly, like standard policing, it concentrates resources. Intelligence analysis fits very well into this strategy. Evidence and theory suggest that combining the focus with a wider array of tactics improves police effectiveness more. That is the form of policing in the upper right part of Figure 1. The three experiments described above illustrate this point. All experiments involved focusing on hot places, but when police coupled law enforcement with other tactics they further increased their effectiveness at reducing crime and disorder.

The role of intelligence analysis in addressing problems is to shed light on how offenders behave so police can craft a solution. In short, intelligence analysis is an integral part of Problem-Oriented Policing. Often this will involve some sort of enforcement, but the enforcement will be highly targeted to have the greatest impact on the problem, and will often be part of a larger set of actions designed to make it harder for any remaining or new offenders to perpetuate the problem.

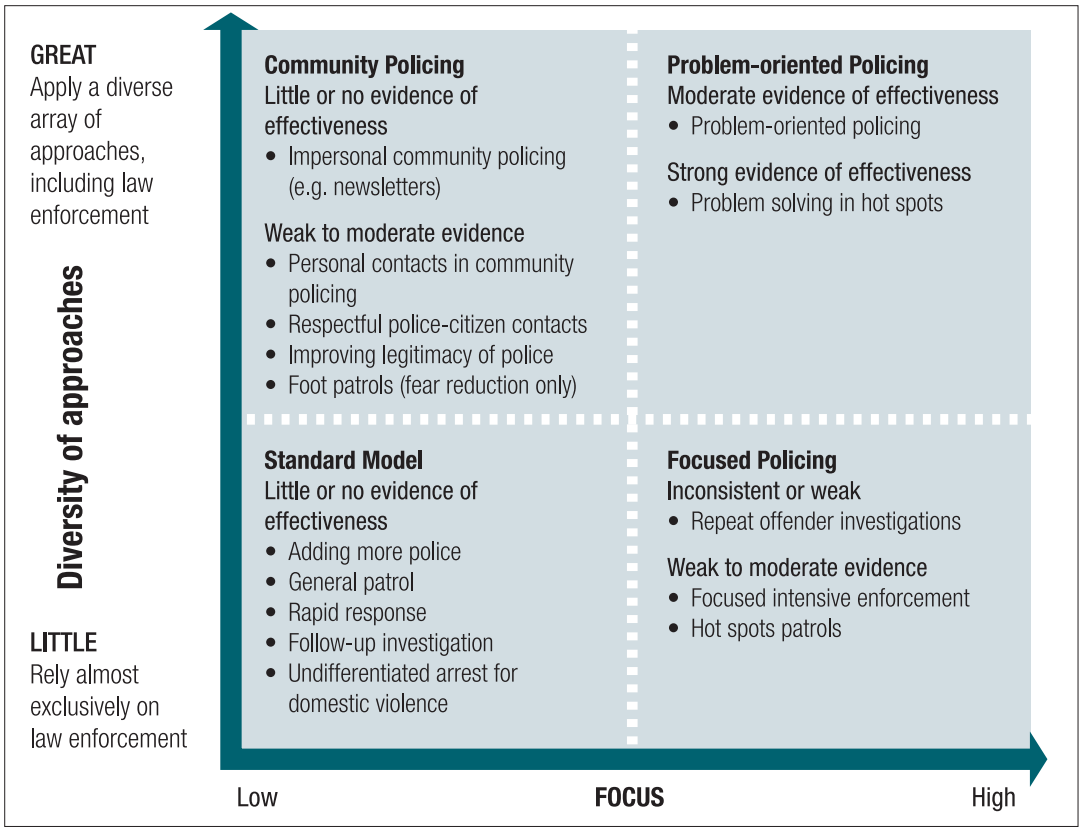
Figure 1. Policing strategy effectiveness



03 UNDERSTAND THE INTELLIGENCE ANALYSIS PROCESS

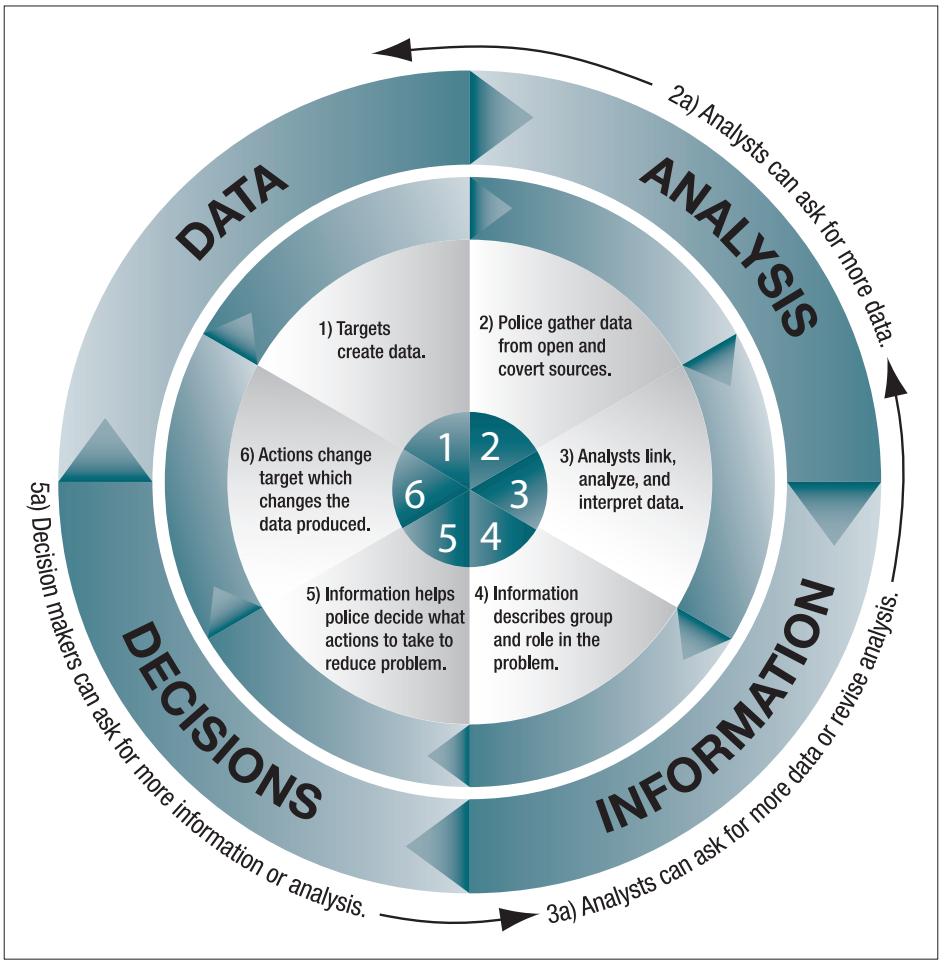
INTELLIGENCE ANALYSIS IS NOT SIMPLY THE COLLECTION OF COVERT DATA, nor is it making sure it is shared appropriately. Although collection and sharing receive considerable attention, and for very good reasons, this attention has obscured the simple fact that they are merely parts of a larger process illustrated by Figure 2. Our discussion of the process follows the numbered stages in the diagram.

1. **Targets create data.** Offender groups are the targets. Citizens might see them. They might act in ways that provoke police stops and arrests. They might write graffiti or create social network pages. They may have bank accounts. They may be recorded by closed circuit television (CCTV). In each of these examples, a person or machine captures data describing group members. In isolation and in these raw forms, these data are relatively meaningless.
2. **Police gather data.** Data from an informant, or on a digital recording device, or in a database needs to be collected to be analyzed. There are data capture processes that are obvious (e.g., police databases of offenders or CCTV footage from cameras near a crime site, confederates of members of an offender group) while other data capture processes require some creative thinking to recognize (see Steps 6–13).
3. **Analysts interpret data** and 4. **Analysts produce information**. Once police or others collect the data, analysts need to combine it with other data and interpret it to produce useful information. An important part of the analysis is determining the validity of the data (for example, is one piece of data consistent with other pieces of data from other sources). Another important aspect of analysis is organizing valid data into a coherent story. Organizing data requires analysts to use two sets of tools. One set of tools comprise analytical techniques: maps, network charts, statistical programs, and so forth. However, theories of groups and how they produce crime are more important than analytical techniques. Theories suggest what data is important and how it should fit with other data. Theories also provide hypotheses that you can test with the data (see Step 21). All good analysts have one or more theories of how they can organize the data to produce a meaningful and valid story. We will discuss several such theories in later Steps 6 through 13. This analysis—with techniques and theories—creates information.
5. **Information helps police to decide what to do.** Information assists decision makers who choose actions. Decisions based on this information create actions whose purpose is to alter that target (for example, arresting members of the group) or the environment in which the target operates (for example, preventing group members from having access to key places, denying them weapons or other tools, or freezing their assets).
6. **Actions change the target and produce new data.** If your analysis has accurately described the offending group and its behaviors, and if the decision maker has used this information, then the actions will change the target. They may remove members of the group, or force the group to alter its behaviors. Ideally, this results in less crime or disorder. Such outcomes are known because the data emitted by the group changes—there are fewer attacks, less graffiti, less drug dealing, and so forth. The new data enters the cycle and helps police adjust their understanding of the group.

In fact, the cycle is more complex than just these six stages described. An intelligence process also consists of a series of feedback loops (2a, 3a, 5a) dependent on the target, information, and the decisions being considered.

- 2a. **Analysts can seek more data** and 3a. **Analysts can revise their initial analysis.** As an analyst, you should not passively accept any data that comes your way. You can request the collection of additional data—for example asking that

Figure 2. Intelligence analysis process



new questions be put to an informant. This new data might help test the reliability of previously collected data. It might fill in critical gaps about a group; it might be used to determine how the group makes use of its environment; or the new data may be needed to help determine which of several alternative hypotheses is more likely to be true (see Step 21). New data might require further analysis or the original analysis may have produced contradictory results so further analysis is needed, for example. The additional data would then have to be analyzed in light of the earlier information.

- 5a. **Decision makers can ask for more information or analysis.** While decisions are being formulated you might be asked for additional information that could help refine the choice of actions. If the information is readily available, you can pass it on to other decision makers. This might require going back further and conducting additional analysis. Or it might even require obtaining additional data.

The analysis process does not end with action against a target. You still need to determine if the actions had the desired effect. Does the group still exist? Have the group's criminal activities slowed down or stopped? Has the group changed its tactics to circumvent police actions? Have other groups moved in to replace the original group? Were there unintended consequences from the actions? Evaluating actions helps decision makers decide whether they should move on to other targets, make adjustments in how they handle this target, or whether their actions failed and they need to start over.

04 RECOGNIZE HOW INTELLIGENCE ANALYSIS FITS INTO CRIME ANALYSIS

CRIME ANALYSTS USE THE TERM "ANALYSIS" TO REFER TO SPECIFIC TECHNIQUES THEY USE, SUCH AS GEOGRAPHIC analysis (i.e., crime mapping) or statistical analysis (to explore relationships among the variables in a data set). But the police use "analysis" in many other ways as well. This creates confusion about the meaning of the term and how "intelligence analysis" fits with other forms of analysis. Here we describe how intelligence analysis is related to other kinds of analysis used by local police agencies.

Perhaps the commonest use of the term by police relates to the type of decision it serves. **Strategic analysis** typically describes enquiries conducted to help long-term broad decisions—such as determining the appropriate approach for addressing repeat offenders. **Tactical analysis** serves shorter term decisions, having a narrower scope. So patrol commanders might ask for a tactical analysis of how best to allocate officers to handle a political demonstration. Intelligence analysis can be used at either level.

Analysis is also sometimes used by police to describe the "customers" for the analytical work, as in the following:

- **Investigative analysis** helps investigators solve particular crimes, or a pattern of crimes.
- **Patrol analysis** is designed to serve the needs of patrol officers and supervisors.
- **Traffic analysis** helps police focus resources on vehicle traffic (though sometimes the term is used to describe drug trafficking or communications traffic).
- **Problem analysis** is used by police and others involved in problem-oriented policing projects to reduce specific forms of crime and disorder.

A crime analysis unit may conduct any combination of these forms of analysis. As we will describe below, intelligence analysis overlaps investigative analysis and problem analysis.

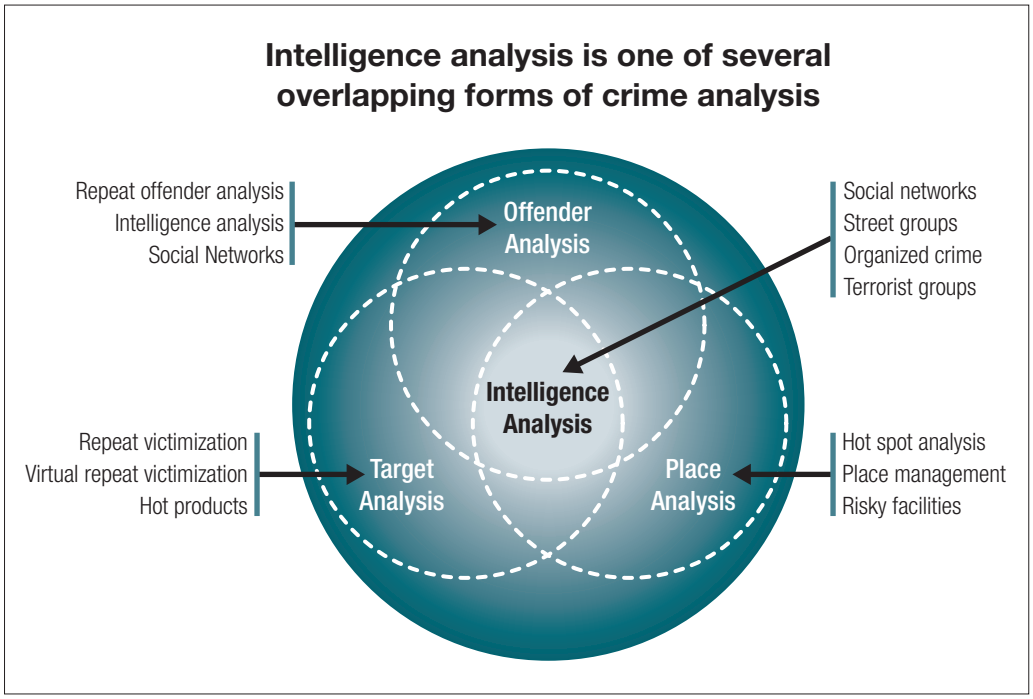
Since crimes involve offenders, targets, and places, there can be analysis that focuses on all three of these elements. **Offender analysis** focuses on offenders, and is closely related to investigative analysis. In contrast, **place and geographic analysis** focuses on various geographic concentrations of crime—such as crime hot spots, repeat crime places, and risky facilities (see the POP Center's *Risky Facilities Guide* for more details). And **target analysis** focuses on the people or things offenders attack. Forms of target analysis include repeat victim analysis, virtual repeat victim analysis, and hot product analysis. These and other forms of target analysis are used in problem analysis.

As shown in Figure 3 on page 17, target, place, and offender analysis overlap and all are forms of crime analysis (the examination of information to help prevent crime). For example, Joe Combs, a detective for the Cincinnati Police Department, discovered that a single apartment complex had an extraordinarily high number of burglaries (both compared to its previous history, and compared to other apartment complexes). Within the complex, several households were burgled multiple times, and most burglaries during this spike in crimes were committed by a small group of offenders (the burglaries declined following their arrest). He had discovered a combination of repeat places, repeat victimization, and repeat group offending.

It is useful to link forms of analysis to the types of problems the analysis is supposed to examine. That is why we define police intelligence analysis as focused on problems created by groups of offenders. Intelligence analysis is related to offender analysis (and investigative analysis) because of its focus on offender groups. Intelligence analysis also overlaps both place and target analysis. Consequently, intelligence analysis is a form of crime analysis as well.

Another way to see how intelligence analysis fits within crime analysis is to compare analysis used in reacting to crime patterns and those forms of analysis that attempt to understand the causes of crime patterns and to develop prevention initiatives. The first we will call reactive and the second proactive. We can also distinguish between analysis focusing on offenders and

Figure 3. Overlapping forms of crime analysis



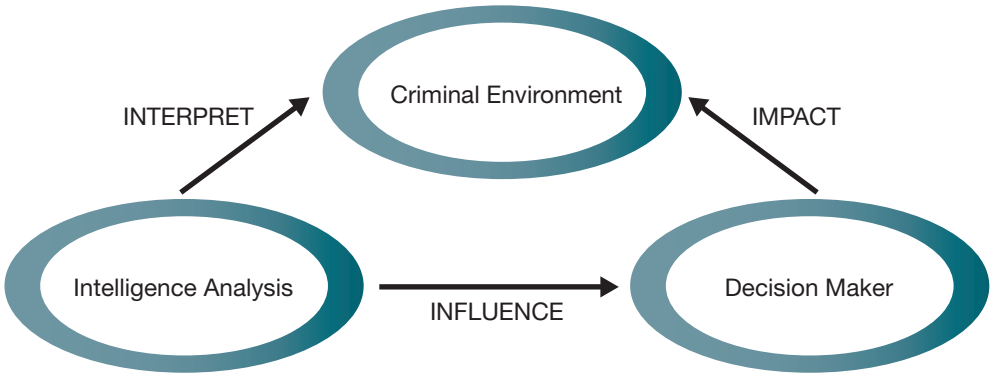
those focusing on crime patterns (such as geographic analysis). This gives us a simple way of organizing some of the most important forms of analysis (see Table 1). Intelligence analysis is a proactive form of offender analysis. It shares this proactive status with place analysis. Both place analysis and intelligence analysis are forms of problem analysis. Also, they stand in contrast to reactive analysis of crime patterns, such as simple hot spot detection and other forms of geographic analysis. This view of intelligence analysis underpins Jerry Ratcliffe's 3-i model, which portrays the role of intelligence analysis as an essential, action-oriented, decision support function (see *The 3-i Model* on page 18).

In conclusion, there is no standard way of classifying analysis types and many forms of analysis overlap. Intelligence analysis shares many features with many types of crime analysis. We believe that the distinguishing feature of intelligence analysis concerns not techniques but the fact that intelligence analysis focuses attention on offender groups.

Table 1. Reactive and proactive forms of crime analysis

REACTIVE AND PROACTIVE FORMS OF CRIME ANALYSIS		
	Reactive	Proactive
Offenders	Investigative analysis – the analyst examines databases to assist investigators solve a crime or crime series.	Intelligence analysis – the analyst pulls together information on problems created by offender groups to help craft methods for reducing that problem.
Locations	Patrol analysis – the analyst examines databases to help determine when and where police should allocate patrol resources.	Place-analysis – the analyst pulls together information from databases, targeted information gathering and other sources to reduce problems at particular locations.

The 3-i model



Jerry Ratcliffe's **3-i model** redefines the role of analysis in an intelligence-led policing environment. Instead of viewing intelligence analysis as simply understanding the criminal environment, the **3-i model** demands that intelligence analysts also identify decision makers and influence their thinking. Decision makers are people who have the power and resources to have an impact on the criminal environment. Thus, intelligence analysts have a leadership role within policing, guiding priorities, and resource decisions.

Ratcliffe's **3-i model** begins with an arrow from analysis to the criminal environment. This emphasis is deliberate. Analysts can't wait for data to come to them: they have to actively seek out the information they need. Creating and disseminating an intelligence product is not a sufficient outcome in the **3-i model**. Instead analysts must identify a decision-making framework they can influence and actively work to help decision makers have a direct impact on the criminal environment. Making recommendations to guide decision makers (both inside and outside policing) to prevent, disrupt or reduce criminal activity is a vital role of the analyst. Learning the theory and practice of what works to reduce crime is crucial.

Ratcliffe's **3-i model** challenges analysts and decision makers to work closely together. It rethinks the role of intelligence analysis as an essential, action-oriented, decision support function.

05 APPRECIATE HOW INTELLIGENCE FITS IN POLICING STRATEGIES

AS MENTIONED IN STEP 2, IN 2004 THE NATIONAL RESEARCH COUNCIL PUBLISHED A COMPREHENSIVE ASSESSMENT of police research and policy. It showed how all policing strategies fall into four groups, depending on the degree to which they focus on specific crime problems and the range of tactics they employ. These four groups are standard policing, community policing, focused policing, and problem-oriented policing (see Table 2). Intelligence analysis plays somewhat different roles in each strategy.

Standard policing makes the least use of intelligence analysis. Standard policing is relatively unfocused and employs a limited number of law enforcement tactics generically across a wide variety of circumstances. The principal tactics are patrolling, reactive follow-up investigations, and rapid response to calls. To improve effectiveness, the main approach is to add more police and do more of the same. Research has shown that at best this has very limited effects on crime, fear of crime, or disorder. Standard policing uses very little information and makes little use of crime analysis to assist in making critical decisions. Intelligence analysis, when used, is the province of highly specialized units that often communicate poorly with standard patrol operations.

Standard policing is ineffective for several reasons. First, it does not use information to focus resources on the relatively few people, places, and circumstances that need the most attention. Consequently, it spreads its resources too thin where they are most needed. Further, the lack of information makes it difficult to develop innovative tactics that exploit the vulnerabilities of offenders. Finally, standard policing puts more emphasis on following routine law enforcement and arrest practices than on preventing crime.

Community policing seeks to bridge the gap between police and community. It places far less emphasis on law enforcement and uses a wider repertoire of policing tactics. However, community policing is relatively unfocused unless it includes a strong component of problem solving. Research evidence suggests that it can be somewhat more effective at reducing crime than standard policing, but the results are ambiguous. Like standard policing, most community policing makes limited use of information technology, crime analysis, and intelligence.

The strength of community policing is that it provides the foundation for the two-way exchange of information between members of the public and the police. This is particularly critical in neighborhoods suffering from high levels of crime and when dealing with crime groups hidden within communities, or

Table 2. Intelligence in policing strategies

	LOW FOCUS	HIGH FOCUS
Limited tactics Mostly Law Enforcement	Standard policing Very little influence on crime Very little use of intelligence analysis	Focused policing Strong influence on crime Intelligence data from limited sources which is used to target enforcement on crime groups
Wide variety of tactics Including Some Law Enforcement	Community policing Modest influence on crime Improves the flow of intelligence data from community members	Problem-oriented policing Highly effective against crime Intelligence from variety of sources is used to craft interventions that curtail crime group activities

intimidating community members. In the absence of community policing, developing intelligence on these groups can be extremely difficult. For these reasons community policing is a necessary condition for effective intelligence analysis. It is a foundation strategy on which other strategies can be built.

Focused policing strategies are a collection of approaches that build on the law enforcement tactics used in standard policing by making much greater use of information. Information is used to identify offenders and places that are disproportionately involved in crime. There is strong evidence that targeting very high crime *places* can reduce crime considerably, but evidence about the usefulness of targeting persistent *offenders* is much less clear. This can increase the chances of arresting the most prolific offenders, but existing studies have failed to examine whether crime declined as a result of such targeting.

Because focused policing places information analysis at the forefront of policing, intelligence is more important for this strategy than for the standard policing or community policing. However, in the absence of community support, only limited intelligence is available. Furthermore, when limited to law enforcement tactics, focused policing does not address the facilitating conditions that allow criminal groups to operate. So focused policing, like community policing, is a foundation for effective use of intelligence. But neither is sufficient on its own and we need to combine community and focus.

Problem-oriented policing, which was developed to address the limitations of standard policing, succeeds in combing community and focus. It was specifically designed to be highly focused—thus capturing the advantages of focused policing—and to use a variety of tactics with the community—thus building on community policing. It addresses any and all aspects of crimes, including the places involved, the targets and victims affected, and the offenders.

Research into problem-oriented policing practices has shown that it is highly effective at reducing crime and disorder. Though there are few head-to-head comparisons between focused policing and problem-oriented policing, the research that is available shows that following a problem-oriented approach has greater benefits than simply focusing on crime hotspots.

The basic principles of problem-oriented policing are simple to state. First, problem-oriented policing places far greater emphasis on what the police are to accomplish—the ends of policing—than on the means of policing. As long as the policing practices are constitutional and legal, are acceptable to the community, are affordable, and have a high likelihood of being effective, problem-oriented policing does not specify what should be done. Instead, problem-oriented policing states that the goals of police are to reduce community problems. Second, problem-oriented policing claims that information needs to be examined to determine how specific problems arise and to determine what sorts of actions can be done to reduce or eliminate these problems. Third, problem-oriented policing calls for a thorough search for solutions to the problem, not limited to law enforcement options. Finally, since the goal of problem solving is to solve the problem, problem-oriented policing requires evaluation of the outcomes of the intervention.

These principles have been codified in the well-known SARA process (see Figure 4). SARA stands for Scanning, Analysis, Response, and Assessment. This is a cyclical model that starts with the identification and definition of a problem (Scanning), followed by detailed analysis (Analysis). Intelligence analysts can play important roles at these initial stages by helping to identify groups that are generating serious crime problems and producing information that describes how they operate. Response is the third stage, where solutions are developed and implemented. Intelligence analysis can help identify possible interventions based on information describing group vulnerabilities.

The last stage (Assessment) is the evaluation of the intervention. Again, intelligence analysis can help determine if the interventions worked by looking at the impact on the targeted group and whether their crimes have declined. In Figure 4, the large clockwise arrows show the standard cycle. The smaller, inner arrows indicate that often a problem-solving process needs to revisit earlier stages as new questions arise or evidence suggests that interventions are not working as expected.

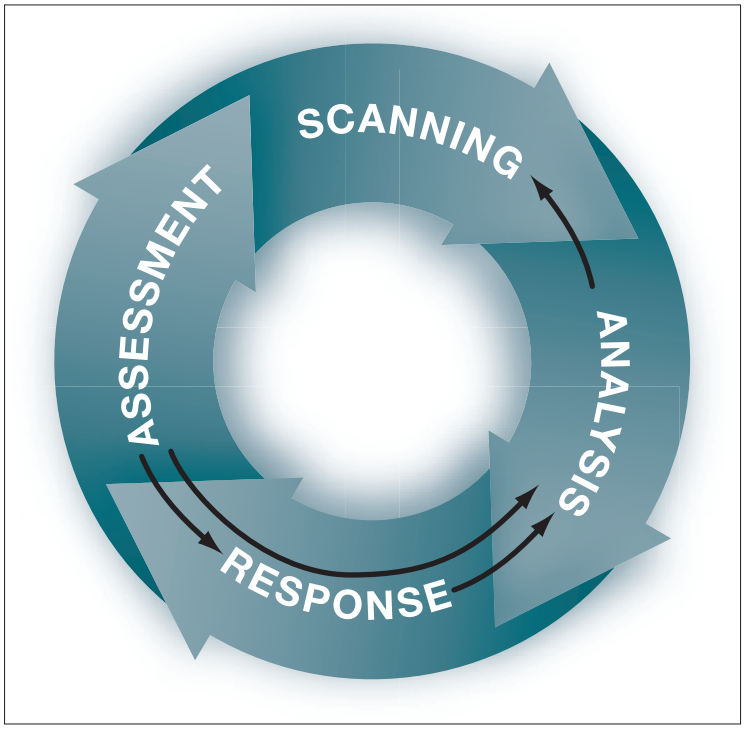
Figure 4. Stages of the SARA process



06 RECOGNIZE THAT OFFENDERS CHOOSE TO COMMIT CRIME

A USEFUL STARTING POINT FOR APPROACHING INTELLIGENCE ANALYSIS is to assume that offenders choose to take advantage of limited crime opportunities. They take advantage of situations where crime is easy, low risk, rewarding, socially encouraged, or provoked. There is considerable evidence that focusing on offender choices can reduce crime, and there are many ways to address crime by blocking opportunities.

"Choice" means that offenders select actions they think will help them achieve their purposes. In making these choices, offenders have limited and sometimes confusing information. They also often have limited time and competing objectives. To address these limits, they use rules of thumb and habit to reduce the information they need and to increase the speed of their decisions. "Do what others in my group do," is one such rule of thumb. "Do what worked before," is another such rule.

Understanding offender choice is critical to intelligence analysis. This is because the principle method of reducing crime is to change these choices. We do this by manipulating the physical and social environment surrounding offenders. There are five choice criteria offenders use: effort, risk, reward, excuses, and provocations. The less effort or risk, the greater the likelihood the offender will commit a crime. The more reward, greater the excuses, or higher the provocations, the more likely the offender will choose crime.

These five criteria influence all people—not just offenders—in all choices—not just offending. Features of the immediate environment signal the individual as to whether a particular set of actions will be useful or counterproductive. The individual then makes a choice. This environment includes the physical setting and the social arrangements. One very important social environment for intelligence is the offenders' group.

An offender in a group may make a very different choice than the same offender outside a group but facing the same circumstances. Groups provide a context that influences individual choice (see Table 3 on page 23):

1. Group members can make crime **easier** by supplying tools, providing transportation, sharing information, and taking on some of the work. A crime that one person cannot do, may be feasible with a group.
2. Groups can make it **safer** (fewer risks) by mutual protection and sharing information about possible risks. Identifying suspects may become harder if witnesses cannot distinguish among several confederates.
3. Groups also make crime **excusable** for their members by justifying the behavior and providing stories as to why the crime is "really necessary."
4. Groups make crime **enticing** to their members through peer pressure, and by providing examples to follow.
5. Groups make crime **rewarding** by giving individual members a sense of belonging, providing an audience to celebrate successful crimes, and other intangible, but important, psychological rewards, in addition to the more familiar tangible rewards of crime.

These attributes, which we collectively call **ESEER**, correspond to standard choice criteria we all use when selecting actions: effort, risk, excuses, provocations, and rewards. These are so critical to understanding crime and its prevention, we will return to them repeatedly throughout this manual.

To an outsider, considering the individual offender in the abstract, the choice may seem inexplicable and even irrational. When examined in the context of a group of offenders, the same choice appears reasonable (even though objectionable). However, groups do not inevitably increase crime. Offender groups can control their members' behaviors so that individuals only choose crimes when it is more likely to aid the group. As we will discuss later (Step 26), it is sometimes possible to exploit the group to reduce offending.

Because individuals seldom have complete knowledge about other members of their group, they may misinterpret the circumstances. One example is called "pluralistic ignorance." This describes circumstances where each member of a group believes other members value something when in fact few if any other members actually value it. However, to please the others, each group member professes that they too hold that value, thus justifying what the others believed. As a result, the group members express a preference that no individual alone would prefer. Within an offender group, no individual may want to get involved in a fight with another group, but thinking that the other members do want to get into a fight, and believing they will lose face if they refuse, all members of the group jump into the fight.

A commonly held misconception is that people in large crowds lose their self-identity and become "irrational." However, considerable research on crowds shows that this is not the case. People make choices in crowds just as they do outside of crowds. The difference is that within a crowd, an individual will also take into account what other people are doing and what is happening to them. From an outsider's perspective, the crowd may seem as a single entity that transcends the individuals that make it up. However, from inside it is clear that a crowd, of any size, comprises individuals and small groups, often with very different interests. Intelligence analysis can play an important role in helping to maintain orderly crowds by providing information on the diversity of interests within a crowd and helping to separate the few troublemakers from the many other individuals.

While offenders take advantage of existing opportunities for crime, they can also manipulate situations to extend opportunities and make new ones. An organized crime group that bribes a local politician creates opportunities for taking public funds. A terrorist group that infiltrates a member into security forces opens up opportunities for further terrorist activities that did not exist before. Street gang intimidation of witnesses expands the ability of the gang to engage in criminal activity. Intelligence analysis should look at how offending groups manipulate their environments to extend their opportunities.

Ronald Clarke. 2008. "Situational Crime Prevention." In *Environmental Criminology and Crime Analysis*, ed. Richard Wortley and Lorraine Mazerolle. Cullompton, Devon: Willan Publishing.

Table 3. How groups influence choices

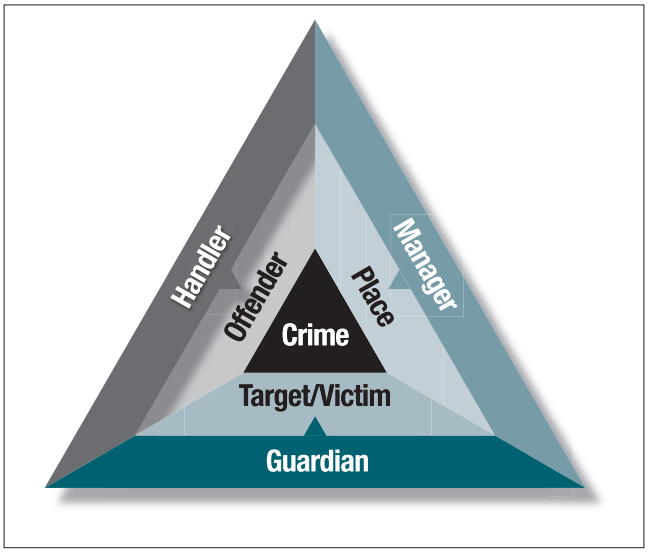
CHOICE CRITERIA	INFLUENCE OF GROUP	EXAMPLES
Effort	Makes crime **easier**	Dividing a complex task or spreading effort among several offenders
Risks	Makes crime **safer**	Providing protection, sharing information, or intimidating witnesses
Excuses	Makes crime more **excusable**	Claiming crimes are permissible or desirable, and denigrating victims
Provocations	Makes crime more **enticing**	Pressuring, encouraging, or guiding members
Rewards	Makes crime more **rewarding**	Providing an audience, status, and reputation

07 PAY ATTENTION TO HOW CRIME OPPORTUNITIES ARISE

THE MOST ESSENTIAL REQUIREMENT FOR CRIME IS OPPORTUNITY. Regardless of a person's motivations, if there is no opportunity there can be no crime. Further, a tempting opportunity may entice a person to commit a crime they would not ordinarily consider. Offender groups can develop to exploit specific opportunities. Human traffickers and smugglers take advantage of two opportunities: the desire of people to leave impoverished countries and the demand for cheap human labor in other countries. Internet commerce created the opportunities that cyber gangs exploit. Drunken bar patrons provide opportunities for youth groups to commit robberies.

Opportunities are situations that offenders can exploit for their gain (e.g., material reward, social dominance, revenge, relief from threat, and so forth). The basic structure of opportunities is often depicted by the problem analysis triangles (see Figure 5). The inner triangle shows the three elements required for a crime to occur: a ready **offender** or group of offenders, a desirable **target** (person, animal, or thing), and a **place** for the two to interact. At minimum, crime opportunities occur when offenders are at places with desirable targets. Removing any one of these three required elements can eliminate the opportunity. Standard law enforcement focuses on offender removal. This can be useful, if the offenders are not easily replaced (Step 13), but there are other ways to reduce crime that also must be considered, either for use with enforcement or as stand-alone options.

Figure 5. The problem analysis triangles



There is more to crime opportunities than these three basic elements: a crime opportunity also requires absence or ineffectiveness of any of the three outer elements of the triangle.

- **Guardians** are people who protect the target—owners of things the offender wants to take or damage, friends of people the offender would like to attack, or security guards hired to protect buildings from terrorist attack.
- **Handlers** are people who try to keep the potential offender out of trouble. They can be parents, siblings, spouses, friends, coworkers, teachers, clergy, and others with whom the potential offender is positively socially connected. They can even be other offenders.
- Finally, **managers** are people who control spaces: owners of locations (private or public), hired employees who work at the location, or others to whom the owner has delegated authority to regulate conduct at the place.

Collectively, we call handlers, guardians, and managers **controllers**, as they control their corresponding elements on the inner triangle. Consequently, in addition to removing one or more of the inner elements, adding one or more controllers helps to reduce crime.

The convergence of offenders with targets at accessible places, in the absence of controllers, makes crime possible. When this happens repeatedly, a crime pattern emerges. Why does this occur? The normal routines of everyday life create most crime opportunities. These include commuting and school schedules. Street drug dealers often locate near commuter routes and when they do so their daily activity patterns follow the routines of commuters

and students. Armed robbery groups can exploit the regular patrons of entertainment districts and drinking routines. The routines of the internet allow fraudsters to exploit users. Natural disasters disrupt some routines, but create other routines that offenders can exploit, including the routines of insurance companies and government aid agencies. Car and suicide bombings by terrorist groups are feasible because people routinely gather at particular places: markets, hotels, and transportation hubs, for example. A peaceful political march creates a routine that small groups of offenders can exploit to create disturbances. Driving routines leave some stretches of highway largely vacant for periods, thus allowing street racing groups to use them. Knowing the spatial and temporal patterns of crime is not just important for allocating law enforcement, it is critical for identifying the routines the crime group is exploiting so that sustainable prevention can be introduced.

Opportunity is in the eye of the offender. Offenders, singly or in groups, judge reward, effort, risk, excuses, and provocations (see ESEER in Step 6) by the presence and absence of the six elements described by the problem triangle. The presence of a target at a place reduces effort while suggesting reward and perhaps providing a provocation. Guardians and managers influence risk and effort. Other offenders can increase excuses and provocations as well as reduce effort and risk. Handlers reduce excuses and provocations, and sometimes rewards.

Offenders, however, can manipulate situations to increase the crime opportunities. Manipulation of opportunities—creating new ones or improving existing ones—is easier for offenders in groups than those operating singly.

Targets and their guardians

Groups enhance the ability of offenders to manipulate targets. A group of offenders has an easier time finding targets because they have more people looking. Sheer numbers can overwhelm a target's defenses and overcome guardians. A group of offenders has greater ability to intimidate victims, thus reducing the chances of effective police involvement. Specialization within a group allows it to undertake complex offenses, from con games to terrorist attacks. A large group, with sufficient resources, can bribe guardians to gain access to targets. Similarly, it can infiltrate a legitimate organization.

Offenders and their handlers

Groups promote offending through recruitment of members and allies. A large group can isolate its members, thus reducing outside influences—such as from parents—and increasing the influence of other group members. In this way, they replace outside handlers with inside handlers. Groups can also promote offender learning. Members of the group learn about what works and what does not to successfully pull off a crime. This information can be disseminated throughout the group and passed down to future members. Importantly, groups produce both excuses and provocations for committing crimes. However, in some circumstances you may be able to take advantage of how offenders in groups handle each other to reduce group violence (Step 26).

Places and their managers

Offender groups can seize control of places that an individual offender cannot. A drug-dealing group can hold a street corner against other dealers more easily than a dealer can on his own, for example. Terrorist organizations in some countries hold large swaths of territory. Offender groups can use places for meetings; for stashing weapons, drugs, and other goods; for prostitution and other human exploitation; for safe houses; and other purposes. Whether seized or purchased, once a place is controlled by the group it can organize the physical space to facilitate its activities. These methods can result in reduced risk or effort, or increased rewards.

Even if the group does not completely take over a location, they can bribe, intimidate, or replace managers so that the group can be sure that the place operates in a manner that helps their activities.

08 DISTINGUISH BETWEEN CRIMINAL GROUPS AND PROBLEM GATHERINGS

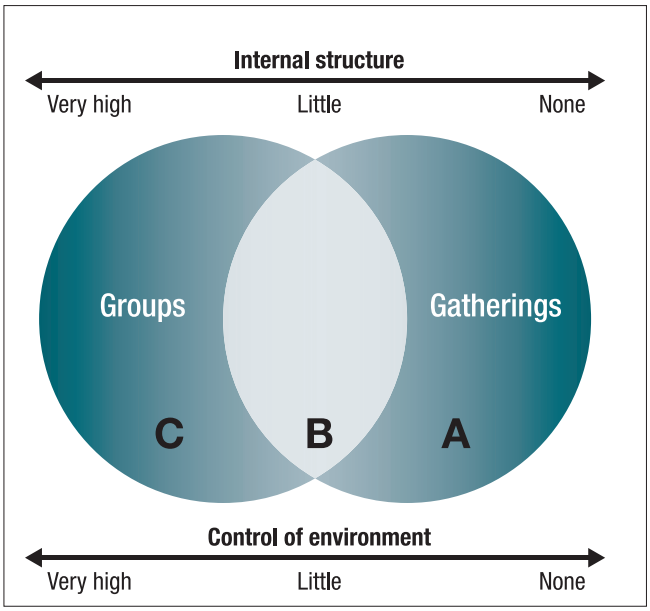
YOU SHOULD DISTINGUISH CRIMINAL GROUPS (such as pedophile rings and outlaw motorcycle gangs) from problem gatherings (such as juveniles involved in cruising or who meet for street racing). In both cases, you need to analyze the conditions that permit them to operate in your jurisdiction and ultimately work to remove these conditions. An important distinction between groups and gatherings concerns their internal structure:

- Groups are composed of offenders connected by some form of internal structure. Examples of structure include routine communications links, hierarchy, chains of command, and recruitment and expulsion practices. These and other forms of structure can be clear, strong, and enduring (area C in Figure 6), but often they are vague, weak, and transitory (Step 9).
- Gatherings are collections of individuals at particular places and time. Gatherings have little or no structure. Many gatherings are only collections at a place and time of separate individuals with no other connections (area A), but some gatherings have weak internal structures, thus overlapping with groups (area B). Typically, many participants have no intent to offend.

Here are three examples illustrating these distinctions:

1. A local bus system efficiently transports students to and from their schools by routing busses through a downtown hub where passengers can transfer. Students from many different schools congregate at the transit hub. If there are no other connections among the students, this is an example of a gathering. Within this gathering, a few individual students may bully and steal from other students, but they do not coordinate their activities in any way. Some of the non-offending students, nevertheless, may provide cover for the offenders. Here, the environment (the school, bus systems, the transit hub, gathering of students) provides an external structure and a set of crime opportunities for individual offenders.
2. Some youths from the same school may travel together so they can intimidate and steal from other students at the transit hub. They target students from a rival school waiting for particular busses at particular times. Here we see the overlap of gathering and group: the offending students have a rudimentary internal structure that helps them exploit their environment, but the environment is still providing most of the structure.
3. A neighborhood street gang robs pedestrians and runs a protection racket for merchants. It has a leader, rules for entry and conduct, and a hierarchy. Members use vehicles to get around and find likely targets. The internal structure here is strong, and allows the group to make use of the environment. Further, the group members can manipulate the environment to further their criminal activities. For example, they may alter the physical environment by using a meeting place and adapting it to their use (e.g., destroying streetlights). Intimidation alters the social environment to reduce their risks of apprehension.

Figure 6. Groups and gatherings



While participants in a gathering are extremely dependent on the physical and social environment, members of a criminal group use their internal structure to control their environment. Internal structure can protect a group's core members from the physical and social environment within which it operates. This means that leaders of criminal groups are exposed to fewer risks from the police and from rival groups. The downside of a group organization is that it is costly—senior members need to compensate junior members and others for the risks they run. Further, as groups become more organized they are likely to grow, and the larger they become, the greater attention they attract from the police. Finally, a tightly organized criminal group is less flexible in adapting to changes in the environment.

Sometimes it will be difficult for you to determine if you are dealing with an organized group or an unstructured gathering. If individual offenders perceive the physical and social environment in the same way, these offenders may behave in the same way and appear more organized than they really are. Here are some hypothetical examples of how this confusion can arise:

- Copper thieves can independently learn that vacant buildings in a particular neighborhood are good targets. Here thieves take advantage of the environment provided. Since each thief sees the same environment, each behaves the same way, even though they are not coordinating their actions. In contrast, an owner of a recycling business might recruit thieves, direct them to vulnerable targets, provide transportation, settle disputes among thieves, and provide guarantees that they are paid. In this case, the owner is creating an organization that is not completely dependent on the environment. To you, the two scenarios may look the same. You could mistakenly believe that in the first instance the thefts were organized or in the second instance that the thieves were disorganized individuals merely taking advantage of an obvious opportunity. Your intelligence analysis can help avoid such mistakes.
- Speeding may be highly concentrated along a particular stretch of highway at particular times, because each driver perceives the same opportunity to speed. Drivers only take into account the road in front of them and the cars in their immediate vicinity, but do not follow instructions from a "head" driver. The stable environment creates recurrent patterns of congestion and speeding. Intelligence analysis is not helpful with such collections (though crime analysis is). Let us contrast this speeding example to illegal road racing. An illegal road-racing gathering needs some organization, but not much because the relevant environment—the street system—is highly predictable and well understood by its members. Members know that on certain nights, particular stretches of road will be highly suitable for racing. The gathering only needs to be organized enough for members to know that others will show up at advantageous times and places and will obey the same rules of conduct. Such a gathering can operate because the environment provides much of the information necessary to coordinate activities. Such a group is highly dependent on this environment—if it changes then the group may have difficulty adapting. Nevertheless, a rudimentary organization facilitates the races.
- A group must be organized if it is to export stolen cars on a routine basis. The environment still produces opportunities (e.g., being near a port city), but to select the types of vehicles the export market wants, in the volume necessary, and coordinate the thefts with the shipping, the offenders must be far more organized than the street racers. Though these offenders are exercising more control over their environment, changes in the environment (e.g., tighter controls over who is allowed into the port facilities) can reduce the ability of this organization to function.

You can reduce the ability of organized groups to commit crimes by breaking them up or by changing the physical or social environment on which they rely. The importance of these two approaches will vary by the internal structure of the organization you are analyzing. The rare extremely organized crime groups will require far more law enforcement effort, though changing the environments can help undermine their capabilities. The more frequently encountered loosely structured organizations will be more vulnerable to environmental changes and less responsive to enforcement. Problematic gatherings, being more dependent on their environments, are best addressed by altering these environments.

09 TELL APART ORGANIZED CRIME AND ORGANIZED CRIMINALS

THE POPULAR IMAGE OF "ORGANIZED CRIME" IS THAT OF LARGE, ENDURING MAFIA-TYPE SYNDICATES, often with international reach, which are involved in a variety of criminal enterprises including extortion, racketeering, drug sales, and human trafficking. These syndicates have strict hierarchies of authority and demand extreme loyalty from their members, who might perform specialist roles. When necessary, they will seek to corrupt officials and they will use violence to enforce obedience from those they exploit or victimize.

While such organizations still exist, their prominence has faded and they now comprise only a minority of organized criminal groups. Far more common are small, organized networks of entrepreneurial offenders, often transitory in nature, that develop to exploit particular opportunities for illegal profit. These groups vary from temporary associations created to commit a time-limited series of offenses, to enduring businesses that invest in on-going criminal activities (see Table 4).

The formal definitions of organized crime recently adopted by the national police forces in the U.K. and Germany, as well as by the European Union, reflect this new reality. In all cases, the definitions try to include the entrepreneurial groups, principally by stating that the organized group can be composed of as few as two individuals. For example, the German federal crime intelligence office, the Bundeskriminalamt (or BKA), defines organized crime as follows:

"The planned violation of the law for profit or to acquire power, where offences are each, or together, of a major significance, and are carried out by more than two participants who co-operate within a division of labor for a long or undetermined time span using: a) commercial or commercial-like structures, or b) violence or other means of intimidation, or c) influence on politics, media, public administration, justice and legitimate economy."

Many of the crimes committed by organized criminals—for example; human smuggling, drug trafficking, sex trafficking, and money laundering—depend on overseas contacts. Opportunities for these crimes have expanded in line with increased globalization and developments in technology. Thus, the growth in international trade has made it easier to import drugs and to export stolen motor vehicles. The rise of the Internet and cell phone technology has made it easier to coordinate transnational crimes. The expansion of air travel has facilitated migration, legal and illegal, which brings with it increased opportunities for crime.

Table 4. Types of criminals

ORGANIZED CRIME SYNDICATES	NETWORKS OF CRIMINAL ENTREPRENEURS
Few in number	Many
Large	Small
Regional/national	Local
Stable, enduring	Unstable, temporary
Outside normal society	Integrated in society
Structured	Loosely knit
Hierarchical	"Flat" organization
Static membership	Fluid membership
Differentiated roles	Undifferentiated roles
Entrenched leadership	Changing leadership
Formal rules/regulations	Informal agreements
Criminal identity	Business identity
Full-time illegal operations	Part-time operations
Ties of loyalty	Business relationships
Use of violence	Avoidance of violence
Crime generalists	Crime specialists
Abundant resources	Limited resources
Sophisticated technology	Everyday technology
Seek opportunities	Respond to opportunities

Source: Bullock, Tilley, and Clarke 2010.

This is because recent immigrants still have ties in their home countries, which enable those so inclined to find the partners needed for transnational crime.

Given the wider definition of organized criminal groups, it is likely that several such groups, involved in quite different crimes, might independently be operating within your jurisdiction. One group might be specializing in home invasions, another in carjacking, a third in sex trafficking, and so forth. This considerably complicates the role of your department in respect of organized crimes and also provides difficult challenges for you in helping your police colleagues deal with the groups.

The purposes of intervention

In subsequent steps of the manual, we discuss in detail a number of organized groups. We will show that each group is different, that you must acquire different data about each one, and you will need to create tailor-made interventions. The purpose of intervening will vary with the nature of the group, as follows:

1. Some of the criminal groups, terrorist cells for example, are so dangerous that the principal objective of police action must be to remove them—i.e., identify and arrest the group members as soon as possible. As in the case of terrorists, this task would often be handed over to the federal authorities.
2. In many other cases, say an organized burglary ring, the prime responsibility for identifying and arresting the group would fall to your department, using largely the same approach when identifying and arresting individual criminals.
3. In a third group of cases, taking out the group might not be realistic or even particularly desirable. In dealing with street gangs, for example, the principal objective will usually be to restrict their capacity, or opportunity, to engage in behavior that is harmful to them or to the community. In other words, when dealing with organized groups, local police will often be involved in preventive action.
4. Even when the primary objective is to identify and arrest a dangerous group, an important additional objective should always be to prevent the formation of new groups to take the place of those arrested. Essentially, this involves applying principles of situational crime prevention to identify and modify the opportunities, or "facilitating conditions," favorable to the formation or operation of these groups. This task, discussed in the next step, puts intelligence analysts in a central role.

Marcus Felson has applied his routine activity theory to develop the following *"Rules for Understanding and Reducing Organized Crimes"*

1. Divide organized crimes into very specific types.
2. Focus on the acts, not the group engaged in them.
3. Expect considerable variation among groups in organization.
4. Assume that such crime is seldom ingenious.
5. Monitor and thwart the opportunity for small-time crime
6. Closely study the *modus operandi* in committing the crimes
7. Find out how crime feeds off legitimate and marginal activities.
8. Tease out the sequence of events for ongoing criminal cooperation.
9. Interfere with that sequence, access to the customer, or *modus operandi*.
10. Use situational prevention to reduce crime opportunities that feed organized crime, directly and indirectly.

10 MODIFY THE CONDITIONS THAT FACILITATE ORGANIZED CRIMES

THE FACILITATING CONDITIONS THAT ALLOW A PARTICULAR ORGANIZED GROUP TO FORM AND OPERATE include both the physical conditions of the immediate situations in which the offenses occur and the wider social arrangements that make the crime possible. We can illustrate these by assuming that your jurisdiction harbors a group involved in stealing cars for export. Some of the facilitating conditions in your jurisdiction might include the following:

1. You are close to the Mexican border, to a deep-water port, or to a ferry terminal that serves Caribbean or South American countries.
2. You have substantial immigrant communities with ties to these countries, or temporary immigrant workers from these countries.
3. Local businesses trade with these countries.
4. The SUVs and pick-ups favored by local residents fetch high prices in these countries.
5. Young immigrant men have been thrown out of work by the recession and have become involved in crime.
6. Nearby border crossings are very busy and vehicles are subject to minimal checks. Ditto for the ports.
7. Too few officers in your department have the language skills to police the immigrant communities effectively.
8. Senior officers do not assign a high priority to vehicle theft.

Not all of these facilitating conditions can be modified—you cannot change the geographic location of your town—but you should focus on those conditions that are potentially modifiable. For example, your department could assign a higher priority to vehicle theft and could recruit more bilingual officers to allow more effective community policing of immigrant neighborhoods. Or your chief could lobby for more effective vehicle checks at border crossings. Not only should you be identifying the scope for these kinds of actions, but you should be arguing the case for their adoption.

How facilitating conditions make crime ESEER

Like much of the guidance in this manual, the framework for analyzing facilitating conditions is drawn from the field of situational crime prevention, specifically from the five principal techniques of opportunity reduction. These consist of techniques that:

1. Increase the effort needed to commit a particular kind of crime
2. Increase the risks of the crime
3. Reduce the rewards
4. Remove excuses for committing the crime
5. Remove specific temptations or provocations

These opportunity-reducing techniques correspond to five categories of facilitating conditions described in Step 6—those that make crime **E**asy, **S**afe, **E**xcusable, **E**nticing, and **R**ewarding, or **ESEER**. With regard to the list of facilitating conditions for theft of cars for export laid out above, it could be said that: 1–3 make it easy; 7 and 8 make it safe; 5 makes it excusable; 6 makes it tempting; and 4 makes it rewarding. ESEER should make it easier for you to think about and identify the facilitating conditions for any kind of crime.

Police efforts to prevent the repetition of a tragic drowning of illegal immigrants in the U.K.

In February 2004, a group of 23 illegally trafficked Chinese nationals drowned while digging for cockles (a shellfish) in Morecambe Bay, Lancashire. The resulting police investigation took 18 months. It required evidence to be collected in China and from European cockle processing plants, it accumulated 1.5 million pages of documentation (many in Mandarin, Spanish, and French), and it involved many different

government agencies in the U.K. and elsewhere. The six-month trial led to manslaughter convictions of three individuals responsible for illegally bringing the Chinese workers to the U.K. and for putting them to work in hazardous conditions.

Despite the enormous cost and effort of prosecuting the case, the Lancashire Constabulary realized that the conditions for a repeat of the tragedy were still in place:

- The scope for vast profits remained. The price of cockles had increased by 400 percent in the four years prior to the tragic drowning.
- Harvesting cockles is simple and relies only on the availability of cheap labor. Chinese networks were still open for recruitment and transportation.
- Illegal immigrants were willing to pay organized criminals up to £20,000 to enter the U.K., this money being deducted weekly from their pitiful wages. Profits were increased by accommodating them in cramped housing and giving them minimal safety equipment.
- Numerous ways to access the vast shoreline provided anonymity to cocklers and their controllers.
- The official permit scheme for harvesting cockles was still lax. On a single day, eight months after the tragedy, 61 Chinese nationals were working illegally on the sands, 48 with fraudulently obtained permits.
- The enforcement of safety regulations had also remained lax. The organized crime group had little interest in the safety of their workers of whom only about 10 percent carried lifejackets, GPS devices, or flares.
- About 100 vehicles transporting as many as 400 cocklers visited the shoreline daily and 80 percent of the vehicles were un-roadworthy, overloaded, or carried roof-riding passengers.
- An estimated 30 percent of cocklers were fraudulently claiming welfare benefits, at an estimated cost per year of £1,200,000.
- U.K. Border controls remained open to exploitation, and the risk of deportation was low. Immigration authorities had insufficient resources to detain potential illegal immigrants, who were released and asked to report to the immigration office at a later date.

Fearing a repeat of the tragedy, the Lancashire Constabulary decided to modify as many of these facilitating conditions as possible. An important priority was to reduce the anonymity of the organized crime group and the exploited workers. The permit scheme was strengthened, but the real innovation was to use existing legitimate workers to assist in identifying illegal workers. This was accomplished through the provision of a "muster point" (a catering van) in a safe location on the sands to communicate legal, procedural, and safety issues. A notice board displayed vehicle and contact details of workers on the sands, tide times, cockle bed information, as well as agency details.

This brought various benefits. Twelve hundred regulated workers were recorded in the new permit scheme and fraudulent unemployment benefit claims were reduced by 20 percent in the first year. Un-roadworthy vehicle usage reduced by 84 percent, with roof-riding eradicated. All workers started to carry personal life-saving equipment. Sea rescue deployments to save cocklers dropped from 34 in 2004 to 1 in 2005. The workforce went on to form their own shellfish association which met weekly and performed a self-policing function.

Detectives uncovered new information about migrant trafficking between China and the U.K., including who were the criminals and associates, how the profits were made, and how money was laundered. This information was insufficient to prosecute offenders, but shining a spotlight on them meant that they were operating in a more hostile environment with associates becoming worried that police attention might be drawn to their businesses. This helps explain why the criminals involved could not simply displace their illegal cockling activities elsewhere in England.

11 STUDY THE MODUS OPERANDI STEP-BY-STEP

CRIMINOLOGISTS HAVE BEEN PREOCCUPIED BY THE QUESTION OF CRIMINAL MOTIVATION—why is that certain people, or kinds of people, become involved in crime and delinquency? In trying to answer this question, they have used hundreds of studies to probe into the backgrounds of offenders and have identified a vast range of possible contributory factors of upbringing, biology, personality, and social circumstances.

These theories are of limited practical value in your work as a crime analyst. This is because police can do nothing to alter an offender's history and little to change society. In any case, at a more down to earth level, motives for crime generally derive from common human failings such as greed, anger, covetousness, and the wish for such things as excitement, revenge, respect, and sexual release. Although some understanding of these commonplace motives may be helpful in analyzing particular categories of crime, knowing *why* crimes are committed is usually less useful than knowing *how* they are committed. This is because a detailed understanding of the *modus operandi* for a specific category of crime reveals many points for opportunity-reducing interventions. This is evident from Table 5, adapted from an analysis by Derek Cornish, formerly of the London School of Economics, showing steps in stealing a car from a parking lot and associated interventions.

Apart from showing a range of possible interventions, the table reveals a little appreciated fact: even a crime as simple as taking a car from a parking lot is not over in a flash, as we tend to think. In fact, it can take quite long to plan, prepare for, and execute—and this table does not even show what happens after the car is taken, how it might be used, sold, or concealed.

If we assume the car has been stolen to order for export, we would need to include, as a preliminary; receiving the instructions about which kind of car to steal, where best to find such a car, and where to deliver it. After the car has been removed from the lot, we would need information about the subsequent stages in getting the car to the ultimate buyer in another country. These include:

1. Bringing the car to a secure location where its identity may be changed and it might be disassembled
2. Storing it until ready to transport across border
3. Loading it in a sealed container onto a ship, either whole or disassembled
4. Or simply driving it across the border
5. At the destination handing it over to a local contact

Table 5. Stealing a car from a parking lot and possible interventions

STEPS	POSSIBLE INTERVENTIONS
Hook-up with co-offender	Use informants in convergent settings (see Step 12)
Get tools (screwdriver, slide-hammer, duplicate keys)	Control sales of duplicate keys and slide-hammers
Enter parking lot	Parking lot barriers; attendants; few entrances
Loiter unobtrusively	Cameras and/or regular patrols to deter loiterers
Reject alarmed cars Choose suitable vehicle	Visible protection of tempting vehicles
Enter car (duplicate keys, use screwdriver)	Cameras to monitor suspicious behavior; improve natural surveillance of lot
Break ignition lock (slide-hammer) or hot-wire ignition	Vehicle alarm to alert security; vehicle immobilizer
Exit parking lot in car	Attendants or other exit barriers; Vehicle-tracking system activated

Source: Cornish 1994.

6. Or having it collected at the dock by such person
7. If necessary having it reassembled
8. Legally registering it if necessary
9. Selling it on the open market or to private buyer

A detailed understanding of these stages would reveal many other possible interventions, though you might be interested primarily in the first four of them because they occur locally and you might therefore be in a better position to impede them, than stages 5–9 that take place overseas.

Laying out the sequence of stages for a problematic gathering can also reveal many intervention points. This is illustrated in Table 6, taken from a POP Guide on dealing with five sequential stages of student party riots: Initial planning; Preassembly preparation; Assembly; Assembled gathering; and Dispersal. The several steps falling under each of these stages yield many possible points of intervention.

READ MORE:

Derek Cornish. 1994. "The Procedural Analysis of Offending and its Relevance for Situational Prevention." Vol. 3 of *Crime Prevention Studies*, 151–196. Monsey, New York: Criminal Justice Press.

Table 6. Intervening to prevent a student party riot

	INTERVENTION	HOW IT WORKS
Stage 1: Initial planning		
1	Create a multiagency task force	Assembles community resources, and clarifies the roles and responsibilities of the groups involved
2	Require students to obtain a permit	Gives advance notice of a gathering, sets standards for the event, and holds hosts responsible for meeting the standards
3	Assign police to assist the hosts	Officers help students to meet legal requirements for a gathering
4	Increase penalties for rioting	Deters students from destructive behavior at the gathering
5	Partner with the media to influence student and community perceptions	Increases positive perceptions of the event and perceptions of risk for those interested in causing a disturbance
6	Work with landlords to ensure renter compliance	Creates more risk for hosting disruptive gatherings on rented property; encourages landlords to assist in preventing these
7	Control alcohol distribution	Reduces student alcohol consumption, underage drinking and purchasing of alcohol, and drunken driving
8	Provide alternative entertainment	Reduces the number of people at a single gathering; provides alternative recreation in a more controlled setting
Stage 2: Preassembly preparation		
9	Ask students to form "student patrols"	Reduces the need for official interventions
10	"Sanitize" the gathering location	Removes objects that can become a safety hazard
11	Monitor ads for gatherings	Notifies authorities of large gatherings in advance
12	Limit parking	Increases the effort needed to attend; removes targets that may be vandalized; clears exits in case of an emergency
13	Close or control traffic flow	Reduces pedestrian injuries; prevents students from bringing in large, dangerous objects

	INTERVENTION	HOW IT WORKS
Stage 3: Assembling		
14	Provide transportation to the event	Facilitates orderly arrival; reduces the number of cars; prevents attendees from bringing large quantities of alcohol
15	Establish a positive police presence	Reduces anonymity and facilitates communication
16	Establish and control perimeters	Prevents the gathering from spreading into the surrounding areas
Stage 4: Assembled gathering		
17	Use alternative deployment methods	Gives officers a tactical advantage over car patrols
18	Use visual deterrents to misconduct	Reminds those attending of the consequences of rioting
19	Videotape the assembled gathering	Reduces anonymity; assists in subsequent investigations
20	Site the media around the gathering	Breaks-up the cohesion of large groups
21	Watch for flashpoints	Immediate intervention can prevent a violent outbreak
22	Standardize the procedure to deal with disturbances	Helps stop violence as soon as it begins
Stage 5: Dispersal		
23	Provide transport from the event	Controls dispersal; reduces drunken driving
24	Facilitate orderly dispersal	Breaks up the gathering before a disturbance begins

12 LOOK FOR CONVERGENT SETTINGS

IN STEPS 8 AND 9 WE NOTED THAT MOST OFFENDER GROUPS ARE LOOSE KNIT AFFILIATIONS OF INDIVIDUALS, rather than tightly controlled hierarchical organizations. How do these groups form, how do they persist, and how do new loose knit groups reform when other groups are broken up?

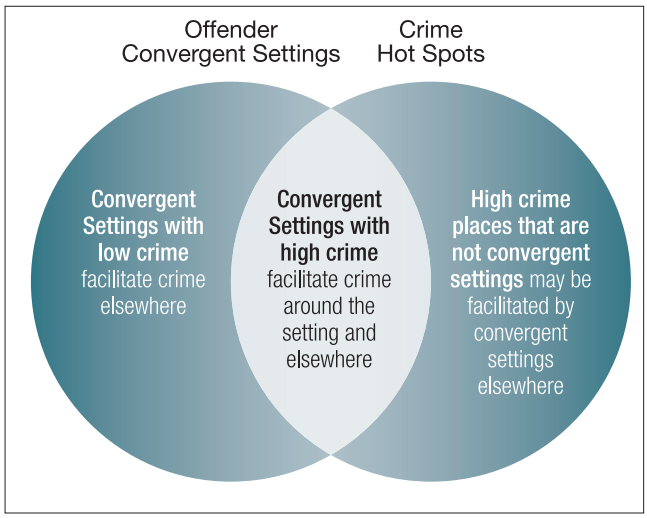
Convergent settings play an important role in these processes. Marcus Felson describes an offender convergent setting as a stable and predictable place where offenders, or potential offenders, can meet and form alliances. A place may be a convergent setting only at particular times. For example, a nightclub may offer a variety of performances throughout the week, but on Friday nights, the management caters to a particular crowd by providing music they find appealing. Potential offenders in this crowd know that if they show up on Friday nights they will find others with the same criminal interests.

The parking lot of a street corner convenience store may provide another example of a convergent setting. The store serves as an anchor for offenders by providing food and shelter for those hanging out. It also provides a ready excuse to be at the location, should a police officer stop the offender.

Convergent settings serve offenders in five ways:

1. **They bring together offenders and potential offenders who would not meet otherwise.** So they provide a spawning ground for offender groups. Many legitimate settings do this. High schools, for example, bring juveniles together who would not meet in other circumstances. The vast majority of these youth do not get into serious trouble, but a few students band together to commit crimes. Any youth gathering spot can serve as a convergent setting that can create groups that would not form in the absence of the convergent setting. Entertainment zones also serve such functions. A few mosques have served as convergent settings that allow Islamic extremists to meet and recruit potential new terrorists. Institutions for offenders—such as drug rehabilitation centers, half-way houses, and prisons—can become convergent settings.
2. **They provide a venue for strangers to observe each other and build sufficient trust and knowledge that they can work together.** If the setting only brings people together for very short intervals, then group formation is difficult. The ability to hang out and talk without looking suspicious is important.
3. **They provide convenient ways for offenders who already know each other to meet.** If an offender knows a bar to be a place where other offenders are likely to be present on a Saturday night, then he just needs to show up. He does not have to make specific plans with other offenders.
4. **They help groups replace members.** Without a replacement process, groups disappear. This is very common. With a convergent setting, it is easy for groups to recruit new members. When group members know that others at the setting are potential offenders this allows easy recruiting. Offenders who want to join a group know that if they routinely show up at a convergent setting, they have a good chance of becoming a member of a group.
5. **In private places they allow group members to meet without scrutiny.** Such places supply venues for initiation rituals, planning of complex offenses, and social support. Whereas public convergent settings are usually created for legitimate reasons and exploited for illegitimate reasons, private offender convergent settings are usually created to serve illegitimate ends.

Figure 7. Convergent settings are sometimes crime hot spots



Convergent settings may also be crime hot spots (see Figure 7). A bar that is a convergent setting for offenders attracts offenders who might take advantage of targets in the area. The opposite is also true. An active drug dealing location may become a convergent setting because it attracts people who want to become part of the drug trade. These wannabe members can provide a temporary labor pool—for carrying messages, serving as look outs, steering customers, or holding guns, drugs, or money—and while doing this can be evaluated for recruitment as permanent members of the group.

Analysts can detect convergent settings that are also crime hot spots through crime mapping. Convergent settings that are not crime hot spots will require you to find other methods of detection. Informants, offender surveillance and tracking, and other techniques will be more helpful than crime maps.

Convergent settings are not always physical places. For example, terrorists can use Internet websites as **virtual** convergent settings. Such websites allow people from around the world to meet and exchange information. Child pornography can be distributed through virtual convergent settings that accelerate the formation of pornography rings.

What should you do about offender convergent settings?

The most important thing is to look for them and exploit them for purposes of collecting data about offenders. Convergent settings can be a rich source of intelligence data describing active offenders: how they are organized, and what they may be doing.

Changing the setting so it does not facilitate offender groups is another important option. This is particularly true if the convergent setting is also a crime hot spot. Since many such settings are public places used by non-offenders, you should give preference to finding ways the place can continue to function without aiding offenders. This is possible if the owners of the place are not involved in crime. If the owner is aligned with the offender group, then regulatory or civil court action may be required to seize control of the place and keep it from being used by offenders.

There can be a conflict between using the offender convergent setting as a source of intelligence data and disrupting offender convergence. Allowing an offender convergent setting to operate in order to gain intelligence data also allows the offender group to continue committing crimes. This may be worthwhile if either a) many non-offenders legitimately use the setting, b) if closing the place simply displaces the convergent setting, or c) the offender group disrupted by the setting's closure is highly likely to be replaced by some other offender group.

On the other hand, altering a convergent setting to reduce crime may cut off vital intelligence and make it difficult to keep track of offender groups. If closing the setting reduces crime, and limits offender groups from reestablishing, then the loss of intelligence is probably a reasonable cost. This seems likely when the convergent setting is the locus of a crime hot spot.

Consequently, before making a decision about how to address a convergent setting, police should consider who else, besides offenders, uses the place; the availability of alternative convergent settings that offenders can displace to; and the chances that another offender group will exploit the situation.

READ MORE:

13 DISRUPT RECRUITMENT AND REPLACEMENT

POLICE WILL OFTEN TRY TO REMOVE KEY MEMBERS OF A CRIMINAL GROUP on the grounds that the broken up group will no longer be a problem. If its members are not replaced, or replacement takes a very long time, then disruption can work.

Before looking at the different forms of replacement, let us examine a generic recruitment process used to varying extent by most offender groups that can replace their members:

- The group must make contact with a potential new member. Convergent settings are useful at this stage and networks of offenders can refer potential recruits to group members.
- Screening or conducting the equivalent of a background check must be undertaken. This may be limited—such as checking on the potential recruit's reputation—or it might be extensive—for example, designed to weed out police operatives or informants.
- Screening may be coupled with testing or testing may be done separately. Testing might involve carrying out simple tasks to see how the subject performs, initiation rites, or even training. Screening and testing will depend on the risks associated with recruiting the wrong person, and on the skill level needed to carry out the tasks.
- Finally, the recruit might be employed as a peripheral member to carry out some minor tasks. Depending on the size and nature of the group, the subject may be promoted.

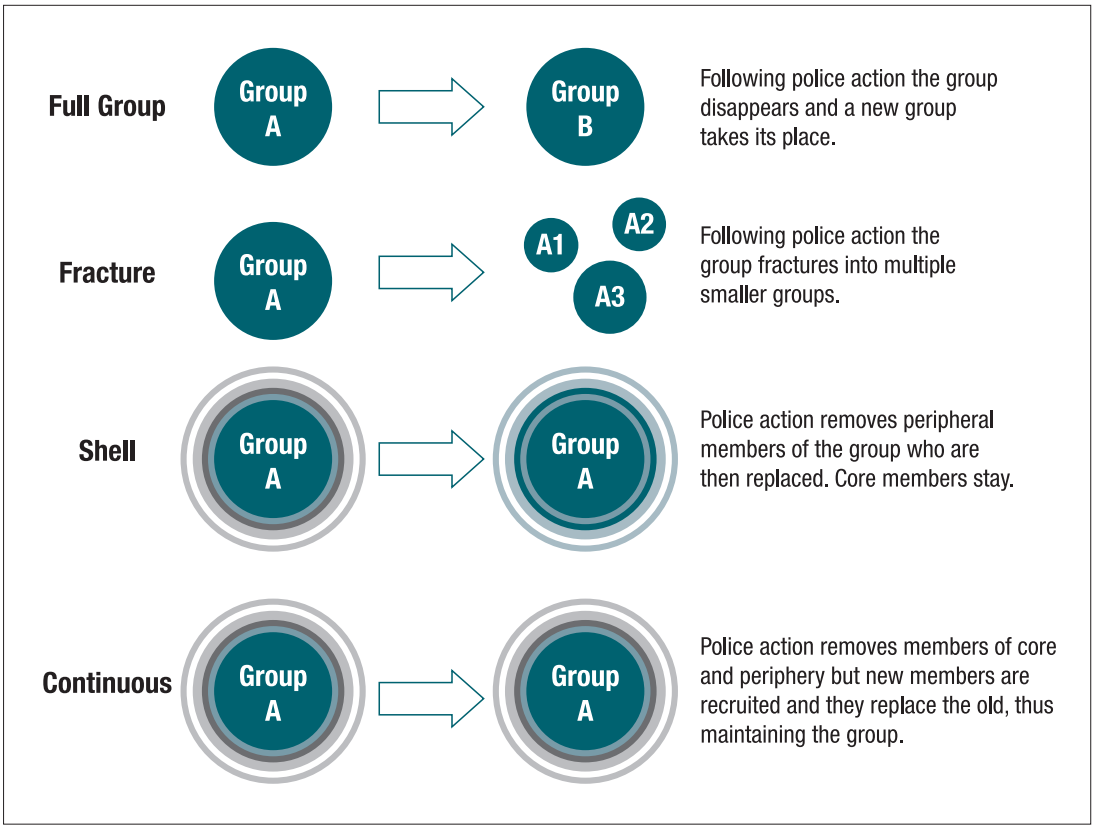
These stages assume varying importance for different forms of replacement.

Forms of group replacement

There are four forms of replacement (as illustrated in Figure 8) that you need to be concerned with:

1. **Full group replacement.** This occurs if the targeted group is incapacitated and totally replaced by another group. Many offender groups have limited ability to replace members, or even desire to do so. A group of young men on a street corner may have formed because they grew up near each other and have known each other for a long time. The members trust each other. Arresting and incarcerating most of them may disband the group, but the remaining members may have little interest in recruiting new members. However, another group of similarly situated young men may then move into the criminal niche that the first group has vacated. While this may not occur immediately, it is likely to occur if the conditions that fostered the first group are still present. Full replacement may also come after groups fight it out for who will take the territory or businesses of the disrupted group.
2. **Fracturing a group.** Removing members of a group may incapacitate the targeted group, but the remaining members may start up several smaller groups and continue the criminal behavior of the now defunct first group. The cottage industry theory of midlevel drug dealing suggests that this is common. According to this theory, many midlevel trafficking groups are loose knit marriages of convenience that form and reform. It could be that fracturing such a group facilitates recruitment of new crime participants because those offenders left on the street might seek out new partners. Fracturing can generate new groups if the conditions that facilitate group crime persist; the remaining members continue to take advantage of these conditions.
3. **Replacement of peripheral members.** If the group is made up of a core set of members surrounded by peripheral participants, then replacement of these peripheral members is possible when police remove peripheral members. The shell of disposable members, who undertake the riskiest activities, protects the core. This is common in retail drug trafficking—core distributors hire locals to sell the drugs and take the risk. It is also used in fraud groups,

Figure 8. Forms of group replacement



where the core players use disposable agents (who might not know the core members' names) to do the dirty work. In these circumstances, unlike continuous replacement, there is no expectation that members in the shell will ever advance to the core.

4. **Continuous replacement.** Some groups have recruitment practices that allow them to bring in new members and promote them. Enforcement may remove members from the core and periphery but the recruitment and promotion processes allow the group to continue its criminal activities. Continuous replacement requires the criminal group to have sufficient size that it can continuously suffer losses and maintain its basic structure. Any criminal group that is large and has existed for many years while under law enforcement pressure has probably mastered this strategy. Outlaw motorcycle gangs may be a good example of this: some have existed for decades with turnover at all levels of the organization.

Conditions for recruitment and replacement

The environmental opportunity structure within which the group operates creates two conditions necessary for recruitment and replacement:

1. The group cannot persist if the environment does not facilitate the particular criminal behavior the group carries out. The environment must provide a set of conditions—the opportunity structure—that permits the group to function. The group is adapted to this opportunity structure. Radical changes in the opportunity structure will limit all four forms of replacement discussed above.
2. There must also be an opportunity structure for recruitment and replacement. One example is convergent settings that we discussed in Step 12. Convergent settings allow offenders to meet other potential partners and permit group members to routinely meet potential new members.

Intelligence analysis needs to focus on the group's environment to understand these two conditions.

Replacement of peripheral members

A police official we interviewed described the following example of the use of shell replacement. In the 2000s, police agencies in eastern Massachusetts took dozens of reports from victims of the "Big Carrot" scam. Victims were called at work by someone claiming to be "Jim, your UPS driver." "Jim" divulged that his brother worked at Sears, Best Buy, or a similar "big box" store that was overstocked on big-screen TVs, or other high-end electronics, and the victims could get a great deal if they would pay cash. The victims met "Jim's brother" outside the store, turned over the cash, and got a handwritten receipt and instructions to pick up their merchandise at the loading dock. By the time they discovered there was no merchandise, Jim's brother had fled.

While many departments arrested dozens of men, they were unable to crack the core group who made the initial calls. They were never the ones to meet victims, collect the money, and hand over the "receipts." Instead, they hired ex-cons to serve as the "runners," who were the ones arrested. None of them knew the names of their bosses, and they were simply replaced with new stooges for the next round of scams. Although police did develop some intelligence on the ringleaders, as of 2010, police still occasionally received reports of these crimes, with no change in *modus operandi*.

14 INTERVIEW OFFENDERS

INTERVIEWING OFFENDERS CAN GIVE YOU USEFUL INFORMATION ABOUT WHY THEY COMMIT THEIR CRIMES, how they decide to commit them, and how they carry them out. You do not need to interview a "representative" or even a large sample to gain considerable insight into the group you are examining. You can sometimes conduct the interviews with offenders who are temporarily in custody, awaiting a court appearance. You might be able to get officers handling the case to ask the questions on your behalf, but you will have to brief them very carefully about the information you want and why. Even after release from jail or prison, you may find it useful to see if offenders are willing to talk about how they and others committed crimes.

Cooperation depends critically on the content of the questions. Make it clear that you are not looking for information about specific crimes they have committed or information about specific co-offenders. Treat the offender as an expert whose insights you are seeking. If you make clear that you are interested in generalities about the crimes in question—how targets are selected, how crimes are committed, ways of recruiting members, etc.—you can get much useful information. Offenders are often willing to talk openly about their crimes if they see no risks for themselves in doing so. This has been shown in many research studies, with different kinds of offenders. If you have little experience with such interviews, seek out an investigator with a reputation for putting offenders at ease and gaining useful information.

It is sometimes important to obtain information from a larger, more representative group. You might also feel it is important to interview active offenders who have not been caught. In such cases, your department may need to contract with a private research firm to conduct the interviews or with a university researcher. Such interviews are commonly undertaken by researchers studying a particular problem (see both Boxes for examples).

Where there is no need to talk with active offenders, they can be interviewed in prison. Again, if you use outside researchers to conduct such interviews, you must brief them carefully about what you need to know. Your agency will have to work out confidentiality and nondisclosure agreements with the researcher so they do not have to report which offenders said what.

Interviewing procedures

Professor Scott Decker of Arizona State University, who has conducted many interviews with offenders, breaks up the task into the eight steps discussed below:

1. *Establish the goal of the interviews before you start.* What gap would the interviews fill and how will that help in your analytic efforts? Do you need to understand the offender's motives, co-offending strategies, and target selection techniques? How will you use this information? It is important to devise a questionnaire to guide your interview.
2. *Decide who to interview.* Interviewing just any member of the group might not be worthwhile. High-rate offenders would usually be more knowledgeable about the operations of the group, other members' involvement, group objectives, and organizational structure. Seeking out the right person for the interview is therefore important.
3. *Determine who should conduct the interview.* This is mostly a matter of who has the skill and the access to the offenders. As mentioned above, if the offender is in police custody, a skilled officer might be able to interview the offender if you provide the questions that need answering. If you have the interviewing skills then you can do it. Interviewing active offenders who have not been caught poses greater difficulties. Locating them and interviewing them 'on their own turf' will require advance intelligence about where these groups operate. In most cases, someone from the police could conduct the interviews, again, with your guidance, but it might be possible to enlist the help of skilled researchers in this task.

4. *Convince offenders to participate.* This is sometimes difficult, although research suggests that many convicted offenders are willing to talk about their own feats. You should consult your local legal counsel to find out what inducements can legally be offered to these offenders in return for their participation, which do not violate policies and professional ethics.
5. *Record the answers.* Use of a tape recorder will allow the information to be transcribed and analyzed in detail. On the other hand, using a tape recorder may jeopardize cooperation.
6. *Analyze interview results.* This can be helped by using hypertext analysis software packages, such as Folio Views or Ask Sam, which allow you to quickly sort through the interview results and identify patterns.
7. *Sort out the truth.* This can be done by repeated questioning to look for consistency, interviewing different offenders about the same issue, or comparing what they say to what is already known through other sources. If you already have some knowledge about the group whose member you are interviewing, that knowledge will help sort truth from fiction.
8. *Use the interview results in problem solving.* Successful interviews will dictate response strategies that you can suggest to your police department. The Boston Operation Ceasefire, for example, used interviews with active gang members to learn about their preferences for guns and the gang's dependence on drug dealing. The results from these interviews led to the use of directed patrol against gang drug sales whenever there were shootings.

Theft of supplies and medicines in hospitals: What nurses said…

Dean Dabney interviewed 25 registered nurses in three hospitals to find out more about the theft of supplies and medicines. Almost all the nurses said that they took supplies from hospital stock, and claimed that this was accepted behavior among nurses who generally believed it was 'kind of compensation.' Thefts of over-the-counter drugs, including painkillers, were very common and were never reported to the hospital authorities. Thefts of non-narcotic prescription medicine was also common; in these cases, nurses take advantage of the lag between the pharmacists realizing that the patient is no longer taking the medicines and when they quit sending them. Thefts of narcotic medicines by nurses, although rare, also occur, but are much more likely to be reported by other nurses.

Source: Dean Dabney. 2000. Neutralization and deviance in the workplace: Theft of supplies and medicines by hospital nurses. In *Deviance and Deviants,* ed. Richard Tewksbury and Patricia Gagne. Los Angeles: Roxbury Publishing.

Incorporating offender interviews in problem solving

The Cincinnati Police Department and researchers at the University of Cincinnati worked together to use offender and victim interviews to reduce street robberies. Police were interested in whether groups of offenders were involved, if the robbers targeted Hispanic victims, and several other questions. Police and researchers developed a set of questions. Two detectives interviewed robbery arrestees and victims, and taped the interviews. At the university, the tapes were transcribed, the transcriptions coded so they could be analyzed, and then the coded date was analyzed. The results showed that the offenders were probably not operating in stable groups, but they had a distinct preference for Hispanic victims who robbers rightfully believed were unlikely to report the robberies. Police used these results to inform members of the Hispanic community in the area.

15 TAP THE KNOWLEDGE OF OFFICERS

PATROL OFFICERS AND INVESTIGATORS ARE IMPORTANT SOURCES OF INTELLIGENCE DATA and tapping their knowledge can be extremely helpful to you. This point is often addressed by developing better procedures for information sharing. Data sharing procedures can help, but they do not go far enough. This is because information sharing can only help when two conditions are met: someone has data of potential use for intelligence, and someone knows that the data is potentially valuable. Former U.S. Secretary of Defense, Donald Rumsfeld, has developed a classification based on these conditions, which we apply in the four cells of Table 7.

If the data is known to be of value to address an offender group, and an officer has the information, then the emphasis should be placed on data sharing (cell 1). However, when police have the data, but do not know its value, then intelligence analysts need to spend more time briefing patrol officers and investigators about what sorts of data is useful. This is sharing information about targets (cell 2).

When no one in the police department has the data, then information or target sharing will not help. If intelligence analysts can identify specific gaps in their knowledge (they know the value of the data, but do not have it), then focused efforts to gain the data can be designed and launched (cell 3).

The most difficult circumstance is that no one knows that the data is of value (though it is), and no one in the police department has the data (cell 4). There is no satisfactory solution to this problem, but there are three practices that can help:

1. If patrol officers or investigators have diverse experiences with a group of offenders, bringing them together to exchange ideas and experiences may be useful. Discussions among police who have very different experiences with the group may challenge some basic assumptions about the group and reveal potential knowledge gaps. The purpose of the discussion is to explore disagreements; consensus and agreement is not the goal.

Table 7. Four problems with using the knowledge of police officers

FOUR PROBLEMS WITH USING THE KNOWLEDGE OF POLICE OFFICERS		
	Data's value is known	Data's value is unknown
Data is known to police	Cell 1 Someone within the police agency has the data, and they know it is useful for intelligence. Improvement in information sharing may help.	Cell 2 Someone within the police agency has the data, but the value of this data is unknown. Sharing target information may help.
Data is unknown to police	Cell 3 No one in the police agency has the data, but it is known that if the data were available, it would be valuable. Targeted data collection may be helpful.	Cell 4 No one in the police agency has the data, and even if that data was collected its value would not be known. Discussions among police familiar with the problem, surveys of police personnel, or theory driven data collection may help.

2. Data may be dispersed among many individuals so that no individual understands that they have useful data. Surveys of officers and investigators can identify: (a) patterns of knowledge that no one was aware of; (b) hidden differences in police understanding; and (c) knowledge gaps that can be targeted for additional data collection. In the late 1990s, the Washington/Baltimore High Intensity Drug Trafficking Area (W/B HIDTA) conducted an annual survey of its many squads to assess commonalities and differences among the offender groups being investigated. The surveys suggested that for the most part, the groups being addressed by the investigative squads were small to moderate in size, not hierarchically organized, and not long lived. This was useful strategic intelligence for the W/B HIDTA.
3. Training officers, investigators, and intelligence analysts in environmental criminology theories may help them understand the problem being addressed. Discussing ways to address offender groups (based on research and experience) can also reduce the circumstances under which police do not know the data they need to collect.

Barriers to information sharing

Patrol officers and investigators may sometimes be unwilling to share information for reasons discussed below. Here we use the familiar framework of risks, effort, rewards, excuses, and provocations.

Risks of Sharing. If officers feel there is greater risk for sharing information than not sharing, then little sharing will take place. Have clear policies and procedures for sharing and hold people accountable for sharing, when sharing is legally permitted. Hold supervisors accountable for assuring adequate sharing.

Effort of sharing. If information sharing is easy, more information will be shared. Reducing the effort necessary to pass information along can be facilitated by making it convenient. If two units routinely need to share information, this will happen more readily when they are located in close physical proximity. Reducing the paperwork burden can also reduce the effort, though this may interfere with holding supervisors accountable for sharing.

Rewards for not sharing. If officers or their units get more rewards for holding on to data than for sharing it, they will not share. Look for ways of crediting officers for sharing. If officers do not learn how the data they provided helped, then they are less likely to share in the future. Giving feedback on the utility of the data increases rewards for sharing. Further, if officers are only asked to give data, but seldom receive data, then they will have less incentive to share. Look for opportunities to provide them with useful data.

Excuses for not sharing. There are four common excuses officers use to avoid sharing intelligence data: it is not my job; there is no one to tell; others already know this; and, I did not know it was useful. Policies and procedures, training, and supervision can address the first excuse. Ensuring that intelligence analysts are known to officers can address the second. Holding discussions with officers and investigators about targets can address the last two excuses.

Provocations for not sharing. If officers and investigators have bad relationships with intelligence analysts, then they are more likely to withhold data than if they have good relationships. While policies, procedures, training, and supervision are necessary, they are not sufficient to assure information sharing. Good personal relationships are essential.

16 WORK WITH BUSINESSES, PRIVATE SECURITY, AND THE CITY

DISASTER PREPARATION ALREADY REQUIRES YOUR DEPARTMENT TO WORK CLOSELY WITH THE MAYOR OR CITY manager, as well as with other city agencies such as fire, emergency medical, hospitals, and schools. Make use of this partnership when gathering intelligence about criminal groups that you may be investigating. In addition, forming partnerships with private security and businesses in your city can help your department in gathering intelligence about criminal groups. This is especially important for dealing with suspected terrorist groups.

Businesses are an important source of information about the activities of criminal groups. For example, banks, check-cashing establishments, and money-transfer stations, such as Western Union, can tell you about suspicious financial transactions or financial transactions of suspect groups; car rental agencies, motels, and real estate agents can give you information about newcomers and transients; and private security practitioners can inform you about organized fraud that might be funding terrorism. Your department should take charge of the partnership, but to obtain full cooperation it should give private sector colleagues public credit for their contributions.

In the United States, private security employees outnumber the police by three to one. They are responsible for the security of most of your jurisdiction's infrastructure and provide visible crime control in the places where people spend much of their daily lives: at work, on public transport, in educational facilities, in shopping malls, and even in gated communities. One of the best ways to approach the larger businesses in your community is through their corporate security officers, but there are many other security professionals in your community who could provide you with valuable help. These include local security consultants, the suppliers of guard services, and installers of security hardware and systems.

You might think you already have good informal contacts with this group, facilitated by the many retired police officers employed within their ranks. However, the Department of Homeland Security recommends that, to serve the goal of preventing terrorism, police chiefs in larger jurisdictions should consider formalizing relationships with private security through coordination agreements or memorandums of understanding. Formalization shows employees from both sides that the partnership is an organizational priority. Specifically, it will help your department do the following:

- Safeguard the critical infrastructure in your community that is protected by private security and ensure rapid recovery in the event of an attack
- Obtain effective help from private security in emergencies
- Improve the flow of information—in both directions. Partnering will allow you to communicate threat information to the private sector efficiently and, conversely, it will allow the private sector direct access to the right people when they need help or want to report information.
- Make use of private-sector knowledge on topics that your department might know little about, such as organized fraud or cybercrime
- Obtain access to private-sector resources and facilities that will help you meet training and operational needs

Perhaps the most critical issue concerns the handling of sensitive information. Your department may be uncomfortable sharing information—especially about terrorist groups—with companies owned by foreign entities and it may not be legally permitted to share information that private security requests, such as criminal histories. For their part, private security may fear that proprietary business information could become public as a result of Freedom of Information Act requests. They might avoid speaking candidly at partnership meetings because competitors could learn about their problems, or because they might be charged with antitrust violations if they discuss inappropriate topics. Finally, they might not report instances of cybercrime because your department might then seize their records and computers. In a word, this all boils down to mutual trust which takes time and patient negotiation to develop.

Getting started

- Clarify the purpose of the partnership and set goals for improved collaboration and coordination
- Spell out what the partnership must do to accomplish its mission
- Identify the resources the partnership will need to meet its goals and find ways to secure these materials
- Find a physical and logistical home for the partnership and appoint a police officer to coordinate its activities
- Decide how the partnership members will communicate, both routinely and in emergencies
- Create an identity for the partnership through the use of a logo, brochure, or website, and use this identity to obtain funds and recruit members

17 WORK THE COMMUNITY

YOU CANNOT OVERESTIMATE THE IMPORTANCE OF THE COMMUNITY: it is the source of most police knowledge about offender groups. Offender groups will attempt to control what community members know about them and what they pass on to police. So, if there is friction between community members and the police, offender groups will exploit this weakness.

By community, we mean people who live, work, study, or play in the area. There are four main ways that the community can assist police in addressing offender groups, corresponding to the four stages of SARA (Step 5).

Identifying concerns and problems (scanning)

Community members are the first to encounter offender groups, if not as victims then as neighbors, acquaintances, customers, or tenants. Before police are aware of a new offender group, people in the community have often detected its presence. This may be one of the greatest values of community policing—taking community concerns seriously and allowing the police to learn early about developing problems.

While police should pay close attention to the community, you should not take all views expressed by the public as equally valid. You should treat expressions of concern regarding offender groups as hypotheses that you need to test (Step 21). Table 8 illustrates this point. Community members may express no concern about some group behaviors—because they do not find these troublesome; they are intimidated; they gain from the behaviors; or they are unaware of them. Police enquiries may indicate that this lack of concern is valid (cell 1) or that there is a serious problem but the public is not expressing concern (cell 2). In contrast, the community may find some group behaviors very troublesome. Analysis may indicate that these concerns are misdirected (cell 3) or that they are fundamentally sound (cell 4). Distinguishing between cells 3 and 4 is often difficult. Community members may have important insights that go beyond data available to the police, but they can also misperceive situations and demand actions that are inappropriate, costly, or violate civil liberties.

Table 8. Community concerns and community problems

	NO EVIDENCE OF A PROBLEM	EVIDENCE OF A PROBLEM
No expressed community concern	1. Issues that can be ignored. But you cannot rule out the possibility of a deeply hidden problem.	2. Determine why the community is unconcerned with the problem and consider expanding work with the community to address the problem.
Expressed community concern	3. Seek data to determine if the concern is valid, or if evidence is negative, determine why some members of the public believe there is a problem. The public's concerns may need redefining. This may not be an issue intelligence analysis can address.	4. Some community members may be in a good position to assist with gathering intelligence.

Knowledge about offender groups (analysis)

The most obvious way community members can help is by providing data on the offender group. You can expect four groups of people to have useful knowledge of the group:

1. **Co-offenders** are community members who are members of the group or knowingly assist the group in its activities.
2. **Victims** are people directly harmed by the group's criminal behaviors. (Many of these victims, especially of group violence, may be co-offenders.)
3. **Place managers** are the owners and managers of businesses, residences, and other facilities that the group uses. These managers may be unaware of the group's activities, they may know what is going on but choose to ignore it, or they may knowingly work with the group.
4. **Others** include neighbors, businesses, delivery workers, and government workers who frequent the area and encounter the group.

The value of the information will depend on how well these people know the group, their physical proximity to the group's area of operation, and the degree to which the group's behavior influences their lives. If the group is well integrated into the community, this might limit the information you can expect to get from the public

Possible ways to address group (response)

Just as community members vary in their knowledge of a group, so does their ability to assist in dealing with the group. Those most knowledgeable may not be those who can do the most about the group. Those who can provide the greatest assistance in addressing problems may not be those who know most about the group. Residents of an apartment building, for example, may know a lot about a gang that uses the building, but they may not be able to do much about it. On the other hand, the owner of the building, who may know the least about the group, has the power to change lease conditions and alter the building's physical environment.

There are three ways members of the public can assist:

1. They have resources and legal powers that can be used against the group. Place managers provide a good example, particularly if the group relies on specific locations for their activities.
2. They have expertise that can be applied to the solution. Such expertise can vary from the ability to help remove an abandoned building or clean up a vacant lot used by a gang, to having computer training sufficient to create a database and website for a community group.
3. They create community and political support for actions against the group. This can be particularly important if the offender group is networked with elected officials, or there is a need to put pressure on business or property owners who facilitate the group's activities. At minimum, you do not want substantial community antagonism to the police efforts, so winning and maintaining public support can be important for solving crime problems. Selling a solution to a community after it has been decided on behind closed doors is often more difficult than including community members in problem solving from the beginning—even if this raises concerns about how much intelligence information can be shared with participating community members.

Perceptions of effectiveness (assessment)

The final way community members can assist intelligence analysis is the evaluation of police actions. If public perceptions are important, then poll community members after police actions to determine if they perceive a reduction in the problem. This can be as simple as informal discussions with members of the public or as rigorous as randomly sampling the public and interviewing them about how they view the problem. For example, if the police take action against an offender group shaking down business owners for protection money, it would be useful to have covert conversations with business owners to determine if they are still receiving threats.

Even if such data is not used to evaluate effectiveness, sharing evaluation results with the community is useful. It may be that while there is strong quantitative evidence of a reduction in the group crime problem, members of the public can point to exceptions that you need to address.

18 CREATE INTELLIGENT MAPS

GEOGRAPHIC INFORMATION SYSTEMS (GIS) CAN ASSIST THE ANALYSIS OF CRIMINAL GROUPS AND PROBLEMATIC gatherings. Geographic analysis allows you to think and communicate "visually" about the problem you are investigating. This can be very helpful in your process of research, analysis, and presentation of the intelligence you have gathered. It can help you provide your police department with timely and accurate intelligence, and also with advice on tactics and deployment strategies.

The questions you might seek to answer using GIS include the following:

- Where are these groups concentrated geographically?
- How dispersed are they in your jurisdiction, state, nationally, or even internationally?
- Can the environmental characteristics of the place where these groups are found give you any additional clues about the group?
- Which kinds of urban areas or cities are these groups more likely to operate in?
- Are there any unique geographic features of the area that hold some special meaning for the groups who live there?
- Have there been geographic shifts in the groups' movements throughout years? If so, what dictates these geographic shifts?
- Can you identify any geographic patterns about the movements or distributions of these groups throughout your jurisdiction, the state, or the nation?
- What targets are most at risk? Where are these targets located?

Geographic analysis and problem-oriented policing

The analysis needed for problem-oriented policing under SARA (Step 4) can also be applied in geographic analysis (see Vann and Darson listed below).

Scanning. Maps can quickly identify crime clusters and hot spots by location, time of day, type of crime, etc. For example, you can use GIS to identify types of crimes committed by the group you are studying. But be cautious. Some problems are not strongly geographical, and will not show up on maps. So do not rely exclusively on maps to detect problems.

Analysis. Maps can be used to relate crime to other spatial variables, such as street layout, transportation arteries, land use categories, locations, and so on. It can also be used to profile crimes that have been committed by the group you are studying, which will give you valuable information on offenders and their characteristics. GIS can also be used to map at-risk targets and locations where these groups operate. In addition, GIS can be used to understand the reasons why the groups commit the crime and how location affects their decision.

Response. Maps can be used strategically (e.g., identifying crime patterns) and tactically (e.g., extrapolating serial crimes to predict anticipated targets). If you have identified at-risk targets and locations, for example, GIS can be used to map the response strategy you are proposing to your department, thus allowing for well-planned resource allocation.

Assessment. Maps can be used as before and after overviews depicting the effects of the intervention proposed. Such examination will allow you to make an assessment of the success or the failure of the intervention implemented.

Cracking down on gangs with GIS

The Akron (Ohio) Police Department's Gang Unit incorporated mapping in their efforts to address the gang problem in the city. The unit used graffiti markings throughout the city to identify the active gangs and to record gang boundaries and track gang activity. Gang Unit officers began by visiting the sites and taking pictures of the graffiti, which were marked with the graffiti's location. The data was then entered into a GIS database to map the boundaries of more than 30 gangs in Akron. Apart from allowing officers to describe the areas where gang activity was present,

this also enabled them to identify overlapping space—"hot zones" or "conflict zones"—where gang conflict was most common. These areas were identified through graffiti portraying insults between the rival gangs. The map of these territories is shown in Figure 9 on page 51.

Tracking gang activity in Orange County, California

Recognizing that gang activity crossed jurisdictional boundaries, the Orange County Chiefs and Sheriffs Association created a countywide Gang Strategy Steering Committee to address the shared problem of gang violence. The committee comprised 22 law enforcement agencies, as well as researchers, local government agencies, the community, and businesses. It created a Gang Incident Tracking System (GITS), which was used, in conjunction with GIS, for mapping and spatial analysis of gang activity in the county. GITS and GIS were used not only for monthly statistics and information management, but also for personnel deployment, strategic planning, and resource management. The data gathered through these systems was used to evaluate gang prevention strategies, and intervention and suppression activities for each individual department, as well as for the county.

Geospatial analysis of terrorist activities

Researcher Brent Smith and colleagues used GIS to examine incidents of terrorism in the United States during the past 25 years. Specifically, the research focused on the planning processes and behaviors that the terrorists engaged in while preparing their attacks. A strong spatial relationship was found between terrorist incidents, terrorists' preparatory behaviors, and where they resided. Fifty percent of incidents happened within 30 miles from where they resided, and this was most apparent among international, left-wing, and single-issue terrorists. The analysis also found, for example, that in the case of environmental terrorists, antecedent activities took place very close to the incident location, with a median distance of about 5.3 miles. For international terrorists, this distance ranged between 271 and 810 miles, implying a quite different planning strategy.

The **Crime Mapping and Analysis Program (CMAP)** provides training to law enforcement agencies in the use of GIS, as well as crime and intelligence mapping. The program is funded by the National Institute of Justice's Office of Science and Technology. CMAP provides useful resources including a crime analysis unit developer kit, free software downloads, publications, and free crime mapping and analysis manuals. Their website is www.justnet.org/Pages/cmap.aspx.

19 USE NETWORK ANALYSIS TO CONNECT THE PLAYERS

NETWORK ANALYSIS ALLOWS YOU TO EXAMINE LINKS BETWEEN MEMBERS OF A GROUP AND RELATIONSHIPS among groups and organizations. It has been applied to investigations of organized crime groups and street gangs, and in uncovering terrorist networks.

It is often important to determine each individual's role within the group. For example, when investigating an organized crime group, you can integrate information from other sources, such as crime incident data, telephone records, and surveillance reports to determine who the leader is; who is responsible for drug supply, distribution, sales, smuggling; who handles money laundering; and so on.

Types of network analysis

Researchers categorize network analysis into three generations according to the degree of complexity:

1. The first generation is a manual approach. It creates a link chart showing criminal associations based on raw data on relationships. This might not be difficult to do when the group is small and the relationships among its members are not complex.
2. Second generation network analysis uses software, such as Analyst's Notebook, Netmap, XANALYS Link Explorer, and COPLINK. These programs can handle large groups and large amounts of relationship data. They permit a visual analysis of relationships among members of the groups and are helpful in determining whether the group is loosely or tightly organized.
3. Third generation social network analysis provides a graphic representation of social networks (also known as a sociogram) and can reveal subgroups, discover patterns of interaction, identify central individuals, and uncover network organization and structure. Because it uses mathematical computations to identify these patterns, it allows less subjectivity on the part of the analyst and reduces the risk of omitting important details. This type of network analysis is becoming widely used by researchers and analysts.

Elements of social network analysis

Key elements to analyze when performing social network analysis include actors, network positions, network structure, network density, and connectedness.

Actors

When studying particular actors or individuals, you should concentrate on gathering information on connections among individuals, places, vehicles, phone numbers, and other things. Personal characteristics of actors are far less important. The fact that Fred often calls Gene's phone, and Gene was seen driving a car owned by Trisha is more important than the fact that Fred is 25 and Gene is 27, and that no one knows Trisha's age.

Network position

Three major concepts in network analysis—degree centrality, closeness centrality, and betweenness centrality—will help you identify the position of actors in the network:

1. Actors with many direct ties to others have high scores on **degree centrality**. They may play an active role in the network, making them more critical.
2. Actors who are physically closer to more actors in the network will have high scores on **closeness centrality**. They are able to easily coordinate tasks and transfer resources within the network.
3. Lastly, those actors who connect many other actors have high scores on **betweenness centrality**. Their removal may prevent contacts between other actors; effectively fracturing the network.

The Royal Canadian Mounted Police use a *Target Profile Sheet* to gather information about actors involved in serious and organized crime.

Personal Data:

- Personal details
- Information on the target's affiliations (e.g., geographic scope of criminal activity, memberships, or addictions)

Criminal History:

- Target's criminal history
- Target's criminal reputation (e.g., position, influence, and importance in the criminal network)

Criminal Roles:

- The criminal capacity of the actor (e.g., crime projects the actor facilitated)
- The current role or primary function of the actor within the network, and how easily replaced

Skills and Experience:

- The expertise and skills that distinguish this actor from others in the group

Finances:

- Known fixed assets and income of the actor and his/her deemed nominees

Vulnerabilities:

- What personal, behavior, status, or relationship aspects make the actor vulnerable or attractive to law enforcement

Social Ties:

- Connections (including family ties), specified by:
  a. The type of the relationship
  b. Frequency of interaction
  c. Degree of criminal association
  d. Degree of licit professional association
  e. The nature of the social relation

The Investigative Research:

- The investigation itself (previous and ongoing efforts)

Network structure

When analyzing the relationships between two or more actors in the group, you are interested in not only the relationships among them, but also cliques or groups of close ties between these actors. That is, you are examining the structure of the entire network—for example, whether it is loosely or tightly organized. This could be important when devising a response strategy. For instance, more open or widely spread networks are more vulnerable to disruption by removing key members.

Network density

The density of a network allows you to determine how close knit or loose knit it is. Figure 10 gives a simple formula for density and applies it to three networks. The first network has less than a third of the maximum possible connections. The second network has all possible connections. Networks that are fully connected (density of 100 percent) are called cliques. The third network is called a cluster because it is at least 80 percent connected. Note that in the first network, three members (E, F, and G) form a clique. In a clique it may be difficult to distinguish between critical and peripheral members.

Connectedness

You may find it useful to determine the degree of connectedness among members, especially when it is vital for you to determine the flow of communication or authority. Connectedness is determined by the direct and indirect ties among the network members (count the connections between two members). In network 1 of Figure 10, one link connects individuals A and B. Two links connect A to D and three to C or E. Four links are needed to get to the other three members.

Network analysis and Operation Ceasefire

David Kennedy and his colleagues made important use of network analysis during Boston's Operation Ceasefire. Members of various criminal justice agencies identified violent gangs and provided information on the gang members. More importantly, they provided information on conflicts among different street gangs, which were translated into sociograms that laid out the gang conflict network (see Figure 11). Gangs not in conflict with other gangs are in the upper right, but are not part of the network.

This seemingly simple information illustrated why particular geographic areas were experiencing high levels of violence. It also revealed which street gangs were most connected within the network and which therefore merited an intervention focus. Finally, it helped to anticipate consequences of interventions by highlighting rival gangs that might attempt to take advantage of law enforcement focus on a particular street gang.

20 UNDERTAKE CONVERSATIONAL ANALYSIS OF WIRE TAP DATA

CONVERSATIONAL ANALYSIS IS USED TO INVESTIGATE CRIMINAL NETWORKS AND PROSECUTE CRIMINAL CASES. It involves compiling and reviewing telephone conversations between two or more people in a criminal conspiracy. It reveals relationships between these people, the key players in crimes, and each member's role in the network.

Procedures

Conversational analysis has three main stages: (1) collecting and transforming the data; (2) analyzing the data; and (3) reporting findings.

In more complex investigations you might find it helpful to analyze the conversations using an Ask Sam or Folio Views—hypertext software programs that allow for storing, sorting, retrieving, and analyzing textual data (see Mangai Natarajan's study described below). In other cases, it can be helpful to produce a written transcript to aid in the detailed analysis of conversations: looking at what is said, and what is merely implied but left unsaid. There are two types of analysis for this situation.

Micro analysis

This consists of two forms of analysis, phonological analysis and syntactic analysis.

Phonological Analysis examines the sounds used by those speaking and is necessary when recordings are not clear—for example, if you have to clarify whether someone said "I wouldn't take a bribe, would you?" or "I would take a bribe, wouldn't you?"

Syntactic Analysis examines sentence structure and helps to clarify grammatical relationships. For example, when a speaker says "I want you to do it," the 'you' maybe ambiguous, since it can refer to the other party involved in that part of the conversation, or it might include other people as well. When someone says "I want *you* to do it" he is most likely referring to the primary respondent in the conversation.

Discourse analysis

Discourse analysis is used to analyze the linguistic aspects of conversations. It comprises a variety of sub-analyses.

Topic Analysis seeks to identify who introduces which topics and whether or not the topics are recycled or reintroduced later in the conversation. This information is useful when establishing the speaker's intentions. Topic analysis is also used to establish conversational dominance. For example, when one person introduces 80 percent of the topics in a conversation, this is indicative of an asymmetrical relationship between the participants, and signifies the person is a leader, or an instigator who is trying to get others to do his will.

Project Caviar

The Caviar network was a criminal enterprise engaged in international drug trafficking. Police in Canada, Europe, and South America ran a two-year investigation that led to the dismantling of hashish and cocaine distribution chains spanning these countries. The primary data submitted as evidence in the trials of 22 members of the network was electronically monitored telephone conversations. These were used to identify primary participants and determine how deeply each person was involved in the trafficking operations.

Response Analysis involves examining the responses to topics introduced by others. Topic response options listed below summarize the most common strategies used by listeners when they have been introduced to a topic. They may:

1. Resolve the topic
2. Resolve part of topic
3. Request clarification or amplification of topic
4. Provide off-topic responses
5. Change or redirect the topic
6. Provide vague, ambiguous, or no response
7. Provide clarification that denies or changes the premise of the topic
8. Deny the topic's premise

For example, if the respondent in the conversation says 'uh-huh,' he is not carefully agreeing to whatever has been introduced. Or when a person does not respond, it generally indicates negativity.

Topic-flow analysis organizes topics sequentially, noting the conversational movement among speakers, and marking the success or failure of the speakers in their efforts to achieve their goals. Topics of discussion are generally put into three categories: substantive topics (the goal of the conversation), corollary topics (ways of achieving or arriving at the substantive topics), and transitional topics (formulaic aspects of a conversation, such as greetings and in-between 'small talk' that often provides psychological breaks from the heavier conversation).

Language function analysis identifies functions of the words used. For example, speakers promise, deny, report facts, complain, give opinions, advise, order, and thank, and they use different linguistic tools to achieve these functions—i.e., using language to get things done.

Contrastive analysis compares phrases used in the conversation analyzed—for example, in an investigative report compiled by police officers. Officers commonly paraphrase the suspect's words so that quite a different message is conveyed from what was actually said. Contrastive analysis will, therefore, allow you to compare and contrast these distinctly different sources of data pertaining to the same people.

Uncovering a drug trafficking organization in New York

Mangai Natarajan of John Jay College of Criminal Justice conducted an analysis in 2000 of wiretap records and other prosecution materials to uncover the structure of a large drug trafficking organization in New York City. She sought to determine the roles and status of the individuals within the organization and to chart the hierarchy among its members. She scanned 600 pages of transcripts of 151 telephone conversations, ranging in duration from 2 to 10 minutes, into "Folio Views." Her analysis consisted of five distinct stages:

1. *Conversational count by individuals.* This yielded a count of the number of conversations each individual was involved in, as well the number of other people with whom he or she had telephone contact.
2. *Status analysis.* This involved the use of a coding guide to determine the relative status of individuals. The guide was used to distinguish between people of higher and lower status, and included such indicators as requesting information, expressing satisfaction, providing information, giving orders, clarifying orders, and use of 'sir.'
3. *Task analysis.* This involved identifying the major tasks performed by each individual by inspecting the content of the conversations. The individuals were identified as bosses, assistant managers, field workers reporting to the assistant managers, and field workers reporting to the chief operator.
4. *Network analysis.* This involved establishing links between individuals (Step 19).
5. *The organizational chart.* This involved developing an organizational chart by using the information obtained from stages 1-4. This is shown in Figure 12 on page 58.

Figure 12. Structure of the drug trafficking organization according to wiretap database

21 COMPARE COMPETING HYPOTHESES

UNFORTUNATELY, YOUR BEST INTELLIGENCE INFORMATION IS ALWAYS INCOMPLETE, often riddled with errors, sometimes contradictory, and typically ambiguous. This is mostly because you are trying to predict the behaviors of people who are trying to conceal their actions from the police. If your best efforts have a high chance of being wrong, how can you improve your intelligence information?

The answer is to consider alternatives and systematically compare these alternatives. Morgan Jones describes an eight-stage approach, developed by the CIA, called Analysis of Competing Hypotheses (ACH). We will follow his description here.

Stage 1: Generate hypotheses. Typically, there is more than one way to interpret data. So it is better to package the information produced from the data as a set of competing hypotheses: a range of plausible alternative interpretations of the data. Sometimes a single analyst can imagine multiple interpretations. But it is often useful to have several people consider the data and come up with alternatives.

Stage 2: Construct a matrix for comparing the hypotheses. Examples are given in Tables 9, 10, and 11. While you can examine any number of hypotheses, it may be more practical to restrict consideration to the most plausible ones, or to the most contrasting ones (that is, minor variations of the same basic hypotheses are lumped together).

Stage 3: List evidence along the left side. Evidence comes from the data already collected. Focus only on significant evidence, rather than many minor details that could be distracting and irrelevant. Also, if the absence of information is important, then this too, is evidence. This will be particularly significant if a hypothesis asserts that certain information should be available, but it cannot be found. Also ask, "What evidence not in the matrix would overturn the hypothesis, if it were available?" Looking for this evidence can help evaluate these hypotheses.

Stage 4: Test evidence for consistency with each hypothesis. Once you list all the evidence, work across (row by row) and determine if each piece of evidence is consistent with each hypothesis. If the evidence is consistent with a hypothesis, put a **C** in the cell for the hypothesis. If it is inconsistent, put an **I** in the cell. And enter **?** in the cell if it is unclear whether the evidence is consistent or inconsistent with a hypothesis. If you wish, you can give degrees of consistency or inconsistency using numbers, symbols, or colors.

Stage 5: Refine the matrix. You may find new hypotheses that had not been considered. These should be added. New evidence may be uncovered and this should be added. Block out any piece of evidence that is consistent with all hypotheses (as is the case with evidence one in Table 10: Matrix 2). Evidence that is consistent with all hypotheses cannot help you determine which hypotheses are the most likely to be true. Do not discard this evidence, as it may turn out to be useful later.

Stage 6: Evaluate each hypothesis. Now, work down and consider each hypothesis separately. Block out any hypothesis for which there is considerable inconsistent evidence. Before making a final decision, consider the quality of the evidence involved. In Table 11: Matrix 3, we have blocked out hypotheses **A** and **C** because three of the four relevant pieces of evidence are inconsistent with them.

Table 9. Matrix 1

MATRIX 1: Testing each piece of evidence for consistency				
	Hypotheses			
Evidence	A	B	C	D
1.	C	C	C	C
2.	I	C	I	C
3.	I	?	I	I
4.	I	C	C	C
5.	I	C	I	I

Based on Morgan 1998

Stage 7: Rank the remaining hypotheses. The hypothesis that is rated the highest has the *least inconsistent evidence*. Hypothesis **B** appears superior to hypothesis **D** in Matrix 3, because it has no inconsistent evidence, though one piece of evidence is ambiguous. Because the data on which the evidence is built can be subject to alternative interpretations, different analysts may have different interpretations. The advantage of the ACH process is that it forces everyone involved to look at all the hypotheses and evidence systematically. It can eliminate the hypotheses that are least likely and narrow the discussion to a few hypotheses. If, at this step, you determine that specific types of data could break the deadlock, then commission additional data collection. When new evidence is available, go back to step 5 and compare the remaining hypotheses with the old and new evidence.

Stage 8: Perform a sanity check. Morgan advocates reviewing the findings to make sure no mistakes were made and that those involved are comfortable with the decision.

Table 10. Matrix 2

MATRIX 2: Eliminating evidence consistent with all hypotheses				
	Hypotheses			
Evidence	A	B	C	D
1.	C	C	C	C
2.	C	C	I	C
3.	I	?	I	I
4.	I	C	C	C
5.	I	C	I	I

Based on Morgan 1998

Table 11. Matrix 3

MATRIX 2: Eliminating evidence consistent with all hypotheses				
	Hypotheses			
Evidence	A	B	C	D
1.	C	C	C	C
2.	C	C	I	C
3.	I	?	I	I
4.	I	C	C	C
5.	I	C	I	I

Based on Morgan 1998

Though you can conduct the ACH process with paper and pencil, the Palo Alto Research Center (PARC) has developed a simple and free downloadable software program. The PARC software has several additional features. It allows you to describe the type of evidence, rate the credibility of the evidence, and rate the relevance of the evidence. It also allows you to give a score to the evidence for each hypothesis and come up with a numerical score for each hypothesis. Finally, though the PARC software has somewhat different steps, the underlying logic is the same as the steps described here.

It is important to remember that ACH relies on the logic of refutation rather than support. In other words, *ACH systematically eliminates the worst hypotheses* (those which are the least consistent with the evidence). In this way it narrows the field of plausible hypotheses. It does not prove a hypothesis is true. The hypotheses remaining are the least inconsistent; least bad.

Though ACH cannot assure that intelligence information is always correct, by forcing a systematic rigorous approach to using data it reduces the chances of error.

22 FIND WAYS TO SHARE VITAL INFORMATION WITH OTHER JURISDICTIONS

RIGHT AT THE BEGINNING OF THIS MANUAL, WE MENTIONED THAT THE 9/11 COMMISSION CRITICIZED INTELLIGENCE agencies for failing to "connect the dots" and that this criticism focused attention on the need to find ways of sharing critical information. As former CIA director, R. James Woolsey, noted in testimony to Congress, "the flow of information sharing is likely to be more from localities to Washington, rather than the other way around." The fact that local police came face-to-face with three of the 9/11 hijackers in traffic stops before the attack is often cited as an example of an opportunity that was lost because an integrated information sharing system was not in place.

We are still struggling with the difficulties of putting such a system in place. The regional Joint Terrorism Task Forces established by the FBI throughout the country before 9/11, represent one attempt to find a solution to this problem. Fusion in many states represents another information-sharing initiative. Information from multiple jurisdictions is pooled and made available to participating police. A center's mission can be limited to antiterrorism, but it often includes other significant crimes, such as insurance fraud, money laundering, and armed robbery. Therefore, these fusion centers can serve as a valuable resource for your department.

Joint Terrorism Task Forces

There are now more than 100 JTTFs throughout the country, including the 56 FBI field offices. Their mission is to coordinate federal, state, and local law enforcement efforts to detect, prevent, and respond to terrorist attacks. Primarily investigative and analytic agencies, JTTF are staffed by FBI investigators, agents from federal agencies—such as the Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF) and the Bureau of Immigration and Customs Enforcement (ICE)—and detectives from local police and sheriff's departments. Several successes have been credited to the JTTF, including the arrest and conviction of the terrorists who mounted the first attack on the World Trade Center in 1993 and of the so-called shoe bomber, Richard Reid.

Impediments to information sharing

In Step 15 we discussed some of the impediments to sharing information among the personnel of a single police department. Here we list six important impediments to sharing information among different departments and jurisdictions:

1. There are more than 17,000 state and local law enforcement agencies in the United States, very few of which have staff trained in a common intelligence curriculum and technology to collate, analyze, and exploit raw intelligence data. Even within the same force, there might be little interconnectivity among existing computer systems.
2. Secrecy is the stock-in-trade of intelligence agencies; historically, protecting sources and preventing leaks has been of great importance. This is why the need-to-know doctrine drives policy on information sharing. Unfortunately, in practice this doctrine inhibits information sharing and, therefore, inhibits new insights that sometimes occur when new eyes examine old information.
3. Particularly in the early stages of an inquiry, it is likely that investigators will guard their information jealously. There are two reasons for this:
   a. Investigators may be wary of leaks that would jeopardize the investigation. They may know that officers in other forces might benefit from the information, but who might also treat it carelessly or misuse it. Consequently, they might not share information when they should have done.

   b. Investigators (understandably) wish to reap the kudos that will result from successfully apprehending the criminals they have been investigating. Sharing the information with some other enforcement agency, particularly one higher in prestige, could result in that agency taking over the investigation, making the arrests, and gaining all the glory.

4. Some crimes, such as terrorism, are rare and it is hard for people to remain vigilant when nothing seems to be happening, and hard to maintain the morale of those doing the watching. Added to this is that useless information is vastly more common than information that is useful. While we often hear stories of intelligence successes, resulting from tips received or surveillance undertaken, we do not hear about the work that leads nowhere. This lack of success can result in a "why bother" attitude and a reluctance to expend the effort needed in pursuing investigations. It also can mean that investigators are reluctant to lose face by sharing information that could prove to be useless.

5. The essence of prevention is stopping something from happening. It can be hard to demonstrate that such efforts have been successful when the agency that collects the relevant information is not the agency that takes the action to prevent the thing from happening. Once again, this fact works against the intelligence function and more specifically against the sharing of information.

6. Finally, there is much misunderstanding of laws and regulations governing the sharing of intelligence. In discussions on this topic someone is sure to bring up 28 C.F.R. Part 23, which only applies to federally-funded multi-jurisdictional intelligence systems, and even then only has very general rules about data access and storage. Many police and analysts seem to think that it prohibits them from sharing data or requires them to do certain things it does not actually require. So try to clarify legal/regulatory impediments that do and do not apply in your particular case.

What, then, should you do to promote information sharing? There are two principles that should guide your approach:

1. Identify key individuals within in or near your jurisdiction, who could be a continuing source of useful information, and cultivate a relationship with them so that they get to know and trust you.

2. When a dealing with a specific problem (for example, one of a criminal motorcycle gang or a pedophile ring) you should identify specific stakeholders with a direct interest in reducing the problem, who would be likely to help you with your investigation.

23 DIAGRAM THE CRIME PROCESS

OFFENDING IS NOT AN INSTANTANEOUS EVENT THAT OCCURS WITHOUT A PAST OR A FUTURE. It is a process that offenders must complete for their crime to be successful. This step and the following one will show you how to diagram such processes so you can disrupt them.

Follow a four-stage procedure for linking the process that offender groups follow in committing crimes to a set of interventions designed to thwart the group's abilities.

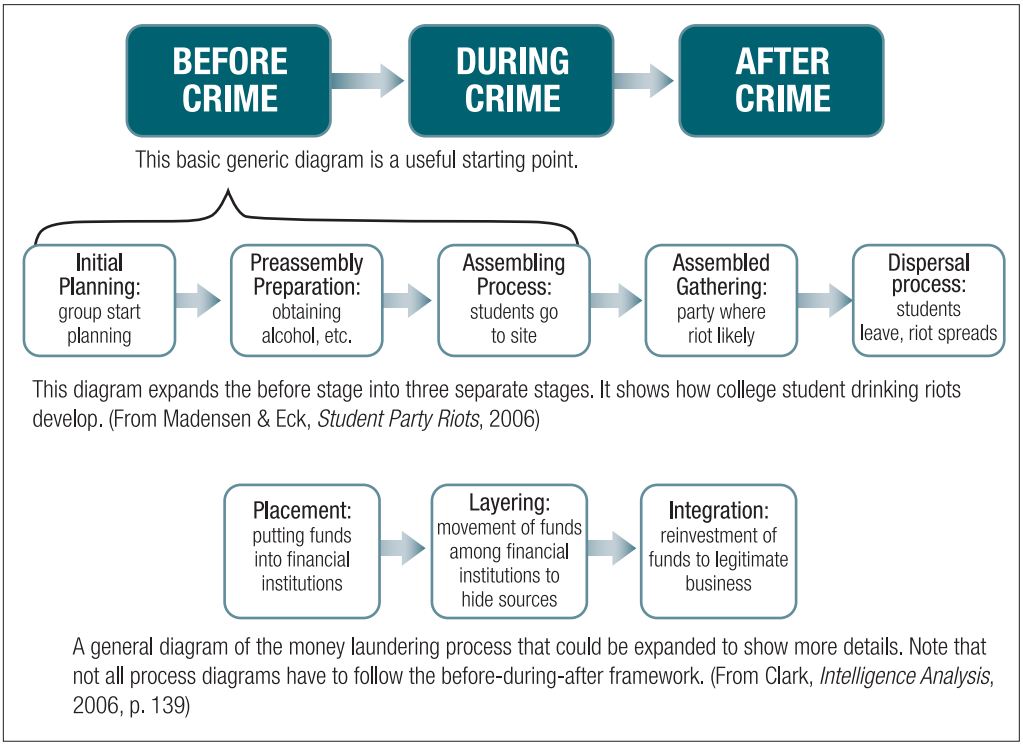
1. Describe the process offenders follow to commit crimes.
2. Add other actors and describe their actions that facilitate the crime.
3. Develop possible prevention interventions at each process stage, for each actor.
4. Select a comprehensive set of actions from these possible actions.

Describe the process

The simplest crime process diagram has three stages that describe what the offenders do before they can commit a crime, during the commission, and afterwards (top row in Figure 13). All preparatory actions, such as finding crime targets, planning, finding weapons and other tools, organizing confederates, and so forth, are in the before stage. In the during stage are all the actions the offenders must take while directly carrying out the crime, including overwhelming victims, gaining access to the site, providing security, and securing valuables. The last stage includes activities such as escaping, disposing of stolen items, threatening witnesses, and laundering money.

Any of the stages can be divided into multiple sub-stages to show the process in greater detail (see second row of Figure 13, and for more detail see Step 11).

Figure 13. Crime process diagrams



This basic generic diagram is a useful starting point.

This diagram expands the before stage into three separate stages. It shows how college student drinking riots develop. (From Madensen & Eck, *Student Party Riots*, 2006)

A general diagram of the money laundering process that could be expanded to show more details. Note that not all process diagrams have to follow the before-during-after framework. (From Clark, *Intelligence Analysis*, 2006, p. 139)

Table 12. Adding details to the model

INTELLIGENCE SUMMARY GRID				
	ACTORS			
WHEN	Group A	Group B	Targets	Place managers
Long Before				What place managers are doing at this stage
Just Before		What this group is doing at this stage		
During	What this group is doing at this stage			
After			What targets are doing at this stage	
Comments:				
In this example, there are two interacting offender groups, their crime targets, and people who own or manage locations critical for the crime. Other combinations of actors are possible, as are different stages of the process. In each cell, describe what the actor is doing at that stage, based on intelligence. For groups, describe what they do to carry off the crime successfully. For targets, describe what they do, or fail to do, to protect themselves. If a cell is empty there is a lack of data.				

The before-during-after framework is useful, but it does not fit all crimes. Money laundering, for example, follows a different process. The model of money laundering in the bottom of the figure is very general. A model for a specific money laundering operation would describe sub-stages within each major stage.

If the offender group has several ways to commit the crime, then you should create multiple models: one for each way.

Add other actors

Since all crimes involve actors other than offenders, a comprehensive process model should account for their actions, too. In Step 7 we introduced the various actors we should be concerned with: offenders, handlers, targets, guardians, and place managers. During the before stage, what are potential victims doing that the offenders can take advantage of? What is being done by the owners and managers of places where the crimes occur? At the during stage, what are all the actors doing? And afterwards, what are all the relevant actors doing?

Table 12 shows how this additional data can be included. The relevant actors depend on the crime problem, as does the number of stages. Empty cells indicate where there is too little intelligence data to determine what a particular actor is doing. If understanding what is going on at this stage is important, then you need to focus data gathering on this cell.

Develop possible interventions

Table 13 on page 65 describes possible prevention actions associated with the actors and stage. Ideally, every cell in the grid would have multiple possible actions. But some cells will be blank indicating that you cannot identify a good preventive action due to a lack of information.

Table 13. Developing responses

INTELLIGENCE SUMMARY GRID				
WHEN	ACTORS			
	Group A	Group B	Targets	Place managers
Long Before	Preventive actions			Preventive actions
Just Before		Preventive actions		
During			Preventive actions	
After	Preventive actions			
Comments:				
In each cell create a list of actions involving that actor who could disrupt the crime process at that stage. Ideally, the entire grid would be filled, but this requires intelligence for each cell. Blank cells indicate where no prevention will be implemented because of lack of intelligence. Once a comprehensive list of actions has been developed, select the combination of actions most likely to be implemented and most likely to have an impact on the problem.				

Select a set of interventions

Having created a list of possible prevention actions, organized by actor and stage, it is time to select the combination of actions that are most productive. The characteristics of a good set of interventions can be described by the acronym EAGLE. The parts are:

- Effective
- Acceptable to the community
- Go well together
- Legal
- Expected to be implemented

To create a comprehensive set of prevention actions; 1) address each stage of the process, and 2) address at least two actors at each stage. This provides a layered attack on the offender group's capabilities that has built-in redundancy. Should some actions fail, or should the offender group attempt to thwart the prevention, other parts of the plan can take up the slack.

READ MORE:

Derek Cornish. 1994. "The Procedural Analysis of Offending and its Relevance for Situational Prevention." Vol. 3 of *Crime Prevention Studies*. Monsey, New York: Criminal Justice Press.

24 APPLY SITUATIONAL PREVENTION TO EACH STAGE OF THE CRIME

COMPLETELY REMOVING THE OFFENDER GROUP MAYBE DESIRABLE, BUT NOT BE POSSIBLE because of offender replacement (Step 13). If members of the group are arrested, new members may replace them. Or new groups can spring up to continue the offending. This is often the case with violent street groups and retail drug dealing organizations. It is also the case with large-scale international criminal organizations. Another circumstance under which removal strategies may be inadequate occurs when removal can provoke violence. Consequently, you need to use other approaches that are complementary with a removal strategy but help thwart replacement and violent competition.

Situational Crime Prevention can be very useful for influencing offender behavior, particularly when offender removal is difficult, replacement is likely, or removal creates additional violence. As we described in Step 6, offenders make choices based on the local context of crime opportunities; they exploit the environment, taking advantage of circumstances that encourage crime. Recall ESEER: if crime is easy, safe, excusable, enticing, and rewarding there will be more crime. Situational Crime Prevention changes the incentives. It alters the social and physical context of crime to make crime harder or riskier, or by removing rewards, excuses, and provocations.

Because different crimes are encouraged by different features of the environment, you need to analyze local circumstances to determine exactly how to influence offenders. To aid the selection of appropriate interventions, a classification of 25 situational techniques has been developed, which is reproduced in Figure 14. We will briefly summarize the 25 techniques below.

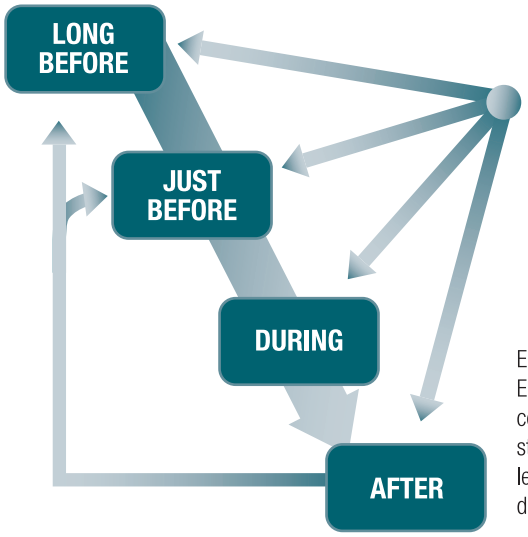
Increase the Effort. Target hardening involves securing targets. Access control makes it difficult for the offender to get to the target. Exit screening makes it difficult to escape with the target, or from the target site. Deflection (for example, through street closures) steers offenders away from targets. Controlling tools makes the crime harder by denying critical resources (e.g., explosive materials) to the offender group.

Figure 14. 25 Techniques of situational crime prevention

Increase EFFORT	Increase RISK	Reduce REWARDS	Reduce EXCUSES	Reduce PROVOCATIONS
Harden targets	Extend guardianship	Conceal targets	Set rules	Reduce frustration and stress
Control access	Assist natural surveillance	Remove targets	Post instructions	Avoid disputes
Screen exits	Reduce anonymity	Identify property	Alert conscience	Reduce arousal and temptation
Deflect offenders	Engage place management	Disrupt markets	Assist compliance	Neutralize peer pressure
Control tools/ weapons	Strengthen formal surveillance	Deny benefits	Control drugs and alcohol	Discourage imitation

Source: R.V. Clarke. 2008. "Situational Crime Prevention." In *Environmental Criminology and Crime Analysis*, ed. Wortley and Mazerolle. Cullompton, UK: Willan.

Figure 15. Applying situational prevention to the entire crime process



Increase EFFORT	Increase RISK	REWARDS	Reduce EXCUSES	Reduce PROVOCATIONS
Harden targets	Extend guardianship	Conceal targets	Set rules	Reduce frustration and stress
Control access	Assist natural surveillance	Remove targets	Post instructions	Avoid disputes
Screen exits	Reduce anonymity	Identify property	Alert conscience	Reduce arousal and temptation
Deflect offenders	Engage place management	Disrupt markets	Assist compliance	Neutralize peer pressure
Control tools/ weapons	Strengthen formal surveillance	Deny benefits	Control drugs and alcohol	Discourage imitation

Each stage in a crime process involves decisions. Each of these can, in principle, be influenced by consideration of offender incentives. The AFTER stage can be particularly important if offenders learn (i.e., outcomes of one crime influence decisions in the next).

Increase the Risks. Extending guardianship involves having citizens do more to protect each other. Assisting natural surveillance is related to this; it makes it easier for citizens to watch an area. Reducing anonymity reduces the ability of offenders to hide by being unknown. Place management involves a wide variety of practices to engage owners of locations in prevention. Formal surveillance employs dedicated security personnel or electronic monitoring.

Reduce Rewards. Concealing targets attempts to hide them from offenders. Removing targets takes this a step further and takes the targets away completely. Property identification involves marking targets so they have less value at resale. Disrupting markets also makes it difficult to sell stolen merchandise or illegal substances and services. Finally, denying benefits entails taking the value out of the behavior (for example by using ink tags in clothing stores that spoil stolen items).

Remove Excuses. Rule setting removes ambiguity for misbehavior and allows early intervention. Posting instructions serves as a reminder about rules. Awakening conscience appeals to offenders' sense of justice. Assisting compliance makes good behavior more likely. Finally, controls on drugs and alcohol make it harder to overcome inhibitions about committing crime.

Reduce Provocations. Reducing frustration and stress makes it harder for offenders to justify their actions. Avoiding disputes keeps conflicts from arising or getting out of hand. Curtailing emotional arousal also reduces temptations to offend. Neutralizing peer pressure keeps offenders from encouraging each other to commit crimes. Discouraging imitation limits information to offenders so they are less likely to copy criminal behaviors of others.

Some techniques may work better together than separately. Thus, rule setting is typically accompanied by posted instructions that serve as veiled threats to an offender. And rules that require people to reveal their identities both removes anonymity and increases the offenders' perceived risk. No technique works in all circumstances for all crimes. Thus, rule setting and instructions alone may be of little importance to a determined offender, but they may deter the more casual, opportunistic offenders. However, all the techniques have an important role in controlling particular crimes in some circumstances.

As we have discussed, intelligence data can be used to determine the process that the offender group uses to exploit crime opportunities. At each stage of the process a situational analysis should be conducted to determine the best ways to keep the group from successfully executing that part of the process. This is illustrated in Figure 15. While it is obvious that curtailing early stages of the process can prevent the group from committing crimes, it is less obvious why

dealing with the final stage is productive. The reason is that it is this stage when the group gets its reward. Whether it is the sales of stolen goods, an enhanced reputation for a killing, or publicity for a terrorist attack, most rewards come at the end. Situational interventions at this stage can substantially reduce the incentive for further crime.

A comprehensive strategy for preventing a group from producing crimes will contain a set of actions at each stage of the group's crime process. While planning a strategy for preventing the group's activities you should describe the situational techniques used at each stage of the process. To provide assurance that the overall strategy will be effective, it is useful to employ at least two different types of techniques (e.g., increasing risks and reducing rewards, or removing excuses and increasing effort) at each stage.

25 WORK WITH GATHERINGS AND CROWDS

IN STEP 17, WE DISCUSSED THE IMPORTANT ROLE THAT COMMUNITY MEMBERS PLAY IN ADDRESSING CRIME. This is particularly true when dealing with large gatherings of individuals, though many of these gatherings are not serious problems for the police. Special events, large block parties, celebrations, and daily commuter crowds typically need the police only to provide traffic regulation, offer directions to citizens, and ensure security against minor crimes. However, demonstrations to protest government policy, to push social or economic agendas, to voice opposition to other political or cultural positions, or to take stands against corporate practices may require active police intelligence analysis before, during, and after the events.

Covert gathering of data about the organizers of the gathering, their intentions, and their plans is tempting, but highly risky because it puts personal liberty in jeopardy. Once revealed, or even suspected, covert gathering of data can undermine the public support for the police.

When dealing with gatherings, intelligence analysis must be considered within an overall police strategy for facilitating individuals' abilities to make their opinions known and carry out constitutionally protected actions, while at the same time preventing violence and other harmful behaviors. Spying on individuals to determine who holds what legitimate beliefs and belongs to what legitimate organization is not permissible in most western democracies. Identifying violent individuals, or individuals who facilitate violence, is a legitimate police activity. The boundary between these two actions is grey, and keeping police actions to the correct side of this boundary is often difficult.

One way to keep police away from this boundary is to get the participants in the gathering to keep order, ostracize troublemakers, and not obstruct focused police actions to remove troublemakers. This may be difficult, but is often easier than imagined because of some basic characteristics of gatherings and crowds, including:

- **Individuals in crowds are rational.** Individuals do not surrender their rationality when in crowds nor do they lose their capacity to make decisions.
- **Large gatherings are diverse.** They contain people with many different perspectives and intentions.
    1. In most cases, only a tiny fraction is seeking to create trouble. This group will use the larger gathering for their purposes and may attempt to provoke the police into taking forceful actions against the larger gathering, and thus gain the support of the other members of the gathering.
    2. Another slightly larger fraction may be willing to facilitate the troublemaking, or join in once it is started. But they are unlikely to act unless the first group provokes the police to over-react.
    3. A much larger proportion of the gathering will stand-by, either confused or puzzled, but if seriously provoked may provide tacit support for the first two groups.
    4. The greatest number of participants in the gathering will try to distance themselves from the troublemakers by leaving the scene once trouble starts.
- **People in gatherings have limited information.** They often know little about what is going on around them. Even with a cell phone and text messages, a person in the middle of a gathering is unlikely to know what is going on at the edges, and those at the head of a march will know little about what is going on at the tail.

Table 14. Dialogue policing before, during, and after a demonstration

BEFORE	DURING	AFTER
Ensure police statements to the media build trust with demonstrators	Check that agreements are kept and facilitate new agreements	Avoid potentially provocative statements in media by the police
Create agreements between demonstration organizers and police	Establish active communication links between police and demonstration organizers	Get feedback on police operations from demonstration organizers
Exchange information between police commanders and demonstration organizers	Prevent hazardous incidents or reduce their seriousness	Explain police actions during the demonstration to demonstrators
Create scenarios for the commander	Read mood in crowds and among police	Give feedback to police on behavior of demonstrators
Involve and inform third parties affected by the demonstration	Inform third parties affected by the demonstration	Exchange information with third parties affected by the demonstration

Adapted from: Holgersson and Knutsson 2010

- **People in gatherings influence each other.** Probably the most important influences on members of a gathering are the people in their immediate vicinity. These are often people who accompany them to the gathering, or who they knew before the gathering.
- **Crowd members and police influence each other.** You cannot understand what the crowd will do without considering what the police will do. And much bad behavior by individuals in crowds is in reaction to police actions, and vice versa. When things go very wrong, it is often because some police and some crowd members co-produced disorder.

To the maximum extent possible, police should facilitate legitimate goals of the gathering. This requires building trust with the leaders of the gathering so their help can be enlisted in policing the gathering. Explaining police actions before, during, and after the gathering is critical. So is having an agreed on plan for the event. Also, because few plans can be implemented without changes, there needs to be a way for police and members of the gathering to communicate.

Overt and bidirectional intelligence is important. The Swedish Police have developed a strategy involving "dialogue policing." Trained officers, dressed in civilian clothes, but clearly identified as police officers, work directly with leaders of the gathering. They pass information about the leaders' intents and concerns to the police commander, and the commander's concerns and intent back to the leaders. They do not spy on individuals in the crowd or report specific illegal behavior—that is the job of others in the police. They seek to dispel rumors and provide a way for the police to negotiate with the gathering's leaders, thereby reducing the anxiety of both the police and members of the gathering. If the police need to take forceful action against specific individuals or a small group, the dialogue officer can explain what is taking place and why.

Dialogue policing is an overall strategy of negotiation and discussion that begins at the earliest stages of planning the gathering (see Table 14). In this context the police can learn a great deal about the gathering without resorting to covert actions.

The dialogue officers are not the only way that information is communicated to the gathering by the police, or that the police gather information about the crowd. Throughout the gathering, police assess the mood of the crowd and modify their actions accordingly. Many of their actions are intended to remove excuses for misbehavior, and to not provoke. At the same time police communicate a specific risk to the few individuals who may be intent on violence, and deny them the rewards of being supported by the vast majority of the crowd. By socially separating those intent on violence from the rest of the crowd, the police make it harder for them to use violence to gain their objectives.

READ MORE:

Stefan Holgersson and Johannes Knutsson. 2010. "Dialogue Policing—A Means for Less Crowd Violence?" In *Preventing Crowd Violence,* ed. Johannes Knutsson and Tamara Madensen, 191–216. Boulder, Colorado: Lynne Rienner Publishers.

26 PULL LEVERS

IDENTIFYING HIGHLY ACTIVE OFFENDERS AND THEN GIVING THEM A DIRECT CREDIBLE THREAT OF LEGAL SANCTIONS can substantially reduce their offending. However, offenders working in a group are more difficult to influence because the group's members can exert strong counter pressure. David Kennedy pioneered a three-pronged approach to reducing group violence, called "Pulling Levers," that not only overcomes this group effect, but also turns it to an advantage. It has been successfully applied in a variety of cities and to problems of street level drug dealing.

Much of the violence in poor neighborhoods is the result of disputes between rival street gangs. The dispute may be over a drug transaction, or a real or imagined slight. Group members encourage each other to violence because they believe that this is expected of them by the other members of the group. In fact, it may be that few if any group members prefer violence, but all believe the others do. In Step 6 we described this as "pluralistic ignorance." Group members also justify their behavior by taking an oppositional stance to legitimate authority, particularly the police, and believe wrongly that they are standing up for the community and have their community's support.

Pulling Levers exploits these mistaken beliefs in order to get group members to regulate each other's conduct. It seeks to accomplish this goal in three ways, all requiring direct communication with offenders:

1. **Providing a direct credible threat.** The objective is to hold the entire group responsible for the violent actions of each member. Standard police practice after a killing is to arrest and prosecute only the offenders directly responsible. Other group members who provide a supporting role are left untouched. Also left untouched are group members not directly involved who have outstanding warrants, are in violation of parole conditions, or in other ways vulnerable to criminal justice sanctions. There is an incentive for those not touched by the investigation to provoke other group members to violence. If one group member takes the fall for a killing, then the other group members achieve higher status. Under Pulling Levers, legal pressure is placed on all group members if one of their members is involved in a killing. The risk is thereby spread to the entire group so there is less incentive for members to provoke each other to violence.

   To accomplish this, two sets of data are needed:

   a. All violent street groups in an area need to be identified and the relationships among these groups need to be established. Some groups will be allied with each other, some will be fighting with others, and some groups may have no contact with others. This information needs to be updated regularly.
   b. All members of each group should be identified: who they are, their descriptions, their criminal histories, where they can be found, and other similar information. This information, too, needs to be routinely updated.

   The network of group members and the network of groups are used when communicating with offenders. This addresses the problem of violence created by pluralistic ignorance by giving all group members a face saving way of backing away from violent encounters.

2. **Providing a way out of street life.** Whereas the first purpose is to convey a direct deterrent threat, the second is to offer a way out of the gang through job training, substance abuse treatment, and other help. This not only affords a way out for individual members of the group, but it also threatens the integrity of the group itself because the real possibility of a positive exit undermines the shared belief that legitimate society is a source of the group's troubles. So even if relatively few group members take advantage of the offer, the possibility of a way out reinforces the law enforcement threat of the first message.

3. **Demonstrating that the community is against violence.** The third objective is to provide the community with a forum for expressing their strong dislike of violent behavior. Community members, particularly those closest to the group members—family members, former group members, and people working in the streets—communicate a dual message: "You are part of the community and we want you safely back. But we strongly disapprove of your violence which is destroying our community and if you do not change we will support the actions of the police to make you stop." Socially isolating the group removes the excuse that they are acting on the part of the community.

The call out session

"Call out sessions" are widely used. Group members are summoned to a meeting, held in a safe venue in which all three messages are conveyed. While it is impossible to get all of them to attend, the objective is to get some members from each group who can then bring the word back to those who did not attend. In Cincinnati, most call outs were held in a courtroom so members in jail, as well as those on parole or probation could get the message.

The police deliver the first message, often supported by federal and local prosecutors and other criminal justice agencies. Outreach workers who can guide group members into job training, rehabilitation, or educational services deliver the second message. Community members deliver the third message.

The first meeting seldom achieves a reduction in violence, but the police and other criminal justice agencies must swiftly carry out their threat when the next killing occurs. Then a second call out meeting is held and the results of the investigation are used to demonstrate that the consequences are real. The other two messages are reinforced and the successes of anyone who took advantage of the exit services are highlighted. This cycle sometimes needs to be repeated several times.

It is important to track the progress of these efforts. Much of the analytical support needed to develop network diagrams and track progress for the Cincinnati Initiative to Reduce Violence (CIRV) is provided by the University of Cincinnati's School of Criminal Justice, which routinely monitors shootings and killings in the city and uses group related homicide trends as a method of monitoring effectiveness.

27 BE ACCOUNTABLE

IT IS OFTEN DIFFICULT TO DETERMINE IF INTELLIGENCE WORK IS PRODUCTIVE, particularly when it serves a long-term initiative to address criminal groups. Its particular contribution as part of such an initiative is also hard to determine. Like all police functions, however, accountability is critical and all intelligence-driven operations should have clear goals and defined outcomes that can be measured.

The single biggest difficulty is that long-term initiatives tend to lose sight of their goals and begin to focus on their activities. When addressing criminal gangs, for example, the emphasis tends to be on numbers of arrests and disrupting the gangs, rather than reducing the harms the gangs are producing. Intelligence analysts can play an important role in keeping the initiative focused on its goals by measuring outcomes and results. This step examines how to incorporate effectiveness measures into the planning of an intelligence-driven initiative. The principles we describe here are not unique to intelligence, but are, in fact, good practice for all policing.

Setting clear goals and developing measures of effectiveness begins early in the planning of any initiative designed to address group-related crime. Intelligence has an important role to play in both setting goals and developing measures of success. That is, you need to determine how you and others will know whether or not the initiative obtained its objectives.

Table 15 lists four minimal requirements for planning an initiative to address a criminal group. Next to each is its accountability measure. The first thing to be decided is what the initiative is supposed to achieve. These are the goals of the initiative. Goals should be described relative to the harms the group produces. **Goals can be stated in terms of absolute numbers or in percent reductions from current levels.** For example, the Cincinnati Initiative to Reduce Violence

Table 15. Planning and measuring

PLAN	MEASURE	WHAT THE MEASURE SHOWS	WHAT THE MEASURE DOES NOT SHOW
Goals: desired level of problem	**Outcomes:** degree of goal achievement	Whether the initiative is effective in curbing the problems created by the criminal group	Whether the benefit is worth the costs **Efficiency:** To measure efficiency divide outcomes by expenditures or by activities
Objectives: anticipated impacts on the group or their environments	**Results:** degree to which objectives were achieved	Whether the initiative is altering the groups' functioning	Problem reduction effectiveness Compare outcomes to results to see if results are productive
Actions: activities planned	**Activities:** actions carried out	What the initiative is doing	Whether the initiative is achieving anything Compare activities to results to determine achievements
Resources: personnel, equipment, information systems, and money needed	**Expenditures:** resources consumed	The costs of the initiative	Whether these costs are "buying" anything of value See efficiency measurement above

(CIRV, as described in Step 26) set goals in terms of percent reductions in group-related homicides to be achieved over a 12-month period.

An intelligence initiative addressing possible violence associated with a political demonstration could set the goal in terms of property damage, injuries, or other harms that should be minimized. The goal ought to be achievable and meaningful. While completely eliminating group-related homicides is certainly desirable, it may not be achievable. A very small reduction may be achievable, but is less meaningful. The expression, "do not let the perfect be the enemy of the good" applies here. An unattainable perfect goal may prevent the achievement of a very good goal.

The outcome of the initiative is the actual measured reduction in harm. **Outcomes are measures showing how close you came to achieving the planned goals.** It would be the actual number of homicides (or actual percent reduction) in the CIRV example. It would be the actual number of injuries or level of property damage in the example of the political demonstration. Outcomes do not describe the efficiency of the initiative. To determine the "bang for the buck" or "value for money," you need to divide the outcome (e.g., crimes reduced) by the resources used (e.g., money expended). Ideally, each unit of the outcome (e.g., homicide prevented) is associated with a low cost.

Objectives describe the impact of the initiative on the group or the facilitating environment. The initiative seeks to change either the group itself—e.g., break up the group, impede its ability to recruit new members, and so forth—or it seeks to change the environment that facilitates the group's crimes—e.g., deny the group access to specific locations, keep the group's members from intimidating community members, and so forth. The theory of your initiative is that if these objectives can be obtained, then this will lead to achieving your goals.

Results are measures of the degree to which these objectives have been obtained. Because group functioning might not be easily observed, results are often documented through interviews with arrested group members, discussions with community members, informant reports, and from similar sources. Regardless of how successful the initiative is in obtaining desirable results, the impact on the group only matters if the harm from the group's activities can be reduced (outcomes). Results do not measure initiative effectiveness (that is what the outcomes measure), but they show possible progress in that direction.

The next stage down from objectives is actions. The planned **actions are the steps necessary to produce the desired objectives.** Examples of such actions are drug buys, surveillance of group members, interviews with victims, and meetings with community members.

Counting the actions carried out, or measuring the time expended on actions produces measures of activities. Activity measures show what you did (but not what you accomplished). Knowing what the initiative does is important so activities can be linked to results, and then outcomes. But activities consume resources so it is not desirable to maximize activities unless they produce commensurate results and outcomes. Ideally, you would have very few activities and produce great results and major outcomes.

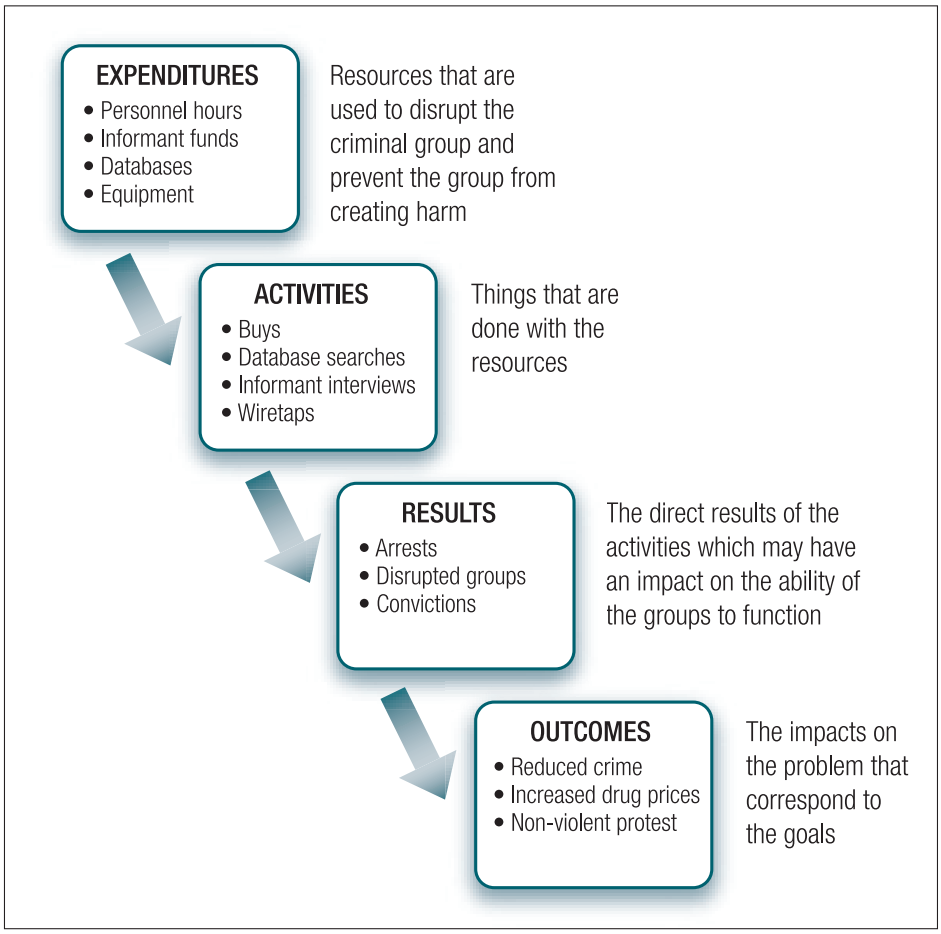
Having determined what actions are necessary to carry out the initiative, the final step is to determine the resources needed to carry out the actions. **Resources are the raw inputs into the initiative.** Typically, the personnel constitute the bulk of resources, while specialized equipment and databases are also often needed.

Expenditures measure resources used, such as personnel time spent on various tasks, informant payments, and fees for access to proprietary databases. It is often useful to monetize expenditures so you can create efficiency measures by dividing outcomes by money expended. A highly efficient initiative achieves large outcomes with little expenditure, while an inefficient initiative costs a great deal and gains little.

In short, expenditures buy activities, which produce results, which create outcomes. This is depicted in Figure 16. While the planning process starts with goals, moves to objectives, then to actions, and ends with resources, the measurement process tracks the actual implementation of the initiative, and works in the opposite direction: from expenditures, to activities, to results, and ends with outcomes.

Tracking these four types of measures over time is critical for ensuring that the initiative is doing what it is supposed to do. If the outcomes are not improving then changes need to be made in the planned objectives and actions.

Figure 16. Measurement schema



28 DO NOT DELUDE YOURSELF

IT IS EASY TO DECEIVE YOURSELF, BUT THIS CAN BE DANGEROUS IN INTELLIGENCE ANALYSIS. When self-deceptions are due to thinking mistakes they are called *cognitive traps;* when due to how the intelligence function is organized, they are called *groupthink*.

Cognitive traps

Richard Heuer shows how intelligence failures result from three limitations of our thinking:

1. When our minds have too much information to process they discard data they judge to be irrelevant.
2. When facts are missing or the quality of data is in doubt, our minds often fill in gaps.
3. When there is limited time available to assess the data, our minds jump to conclusions.

These limitations result in our minds using short cuts, or **heuristics**, to speed up thinking. Heuristics are helpful in everyday situations when they fit the situation, and when the costs of being wrong are small. **Cognitive traps** arise when the heuristics do not fit the situation.

Table 16 on page 78 and 79 lists common heuristics and related cognitive traps in the first three columns. The fourth column describes situations where the heuristics can be useful. The last column describes ways of avoiding traps when the heuristic does not apply.

Groupthink

Groupthink is the tendency of a team to reach a conclusion that reduces internal conflict, rather than addresses the problem. It is most prevalent when the team: (a) lacks diversity; (b) is isolated from groups that may have alternative points of view; and (c) has no clear rules for decision making that make it safe to voice conflicting opinions. Groupthink becomes worse when the team's decision making is dominated by a single person or faction. In the extreme, a senior police executive or elected official dictates a party line that constrains the team's analysis.

Groupthink can be reduced; (a) by increasing the diversity of backgrounds and experience of participants; (b) by creating explicit rules for discussion that require airing opposing viewpoints; and (c) by promoting values of getting the story right and reducing the problem, rather than creating a consensus and focusing on enforcement.

Judge the strength and weight of evidence. *Strength refers to the role the evidence plays in confirming or falsifying a hypothesis. Weight refers to the degree that the evidence can be trusted.* An informant may report that leaders from two rival gangs recently met to plan an attack on a third gang. This confirms analysis about the changing relationships among gangs. If the informant has a history of spreading false rumors or it is doubtful that the informant could have firsthand knowledge of the meeting, then the weight of the evidence is small, though the strength may be high.

Guard against inflating a problem

Christopher Bruce has reminded us that police and analysts tend to equate their own self-worth with the seriousness of the crimes and the danger posed by the criminal groups they are investigating. Consequently, officers, analysts, and, on occasion, entire police agencies exaggerate certain crime problems. This is largely unintentional, though it might play well in the media and might help garner more resources for the department. However, it can have more pernicious effects. Relatively harmless groups of kids may get treated like gangs, immigrant communities harboring nothing more serious than a few illegal immigrants may be treated like havens of terrorism, and every gathering of motorcycle enthusiasts is policed as if the Hell's Angels are mobilizing for war.

Table 16. Heuristics and cognitive traps in intelligence analysis

HEURISTIC	EXPLANATION	EXAMPLE	WORKS IF…	COUNTERMEASURES
Anchoring	The initial guess strongly influences the final estimate.	An initial estimate that a biker gang has 100 members influences later estimates. If this first guess is wrong, so will be later estimates.	The people making the first estimate have a good track record for accuracy.	Consider multiple first guesses that are very different.
Tunnel vision	Focus on a narrow range of alternatives, often just one.	Only enforcement is considered for addressing an offender group. Other tactics might work better.	There is strong evidence supporting the narrow range of alternatives.	Use evidence-based approaches, when available. When not, seek out a range of alternatives, including unusual ones.
Select the first	Choose the first alternative as being good enough.	The first explanation of the group's behavior that fits the data is chosen. Alternative explanations that might also fit are not considered.	The cost of a mistake is small and speed of decision is critical.	Even when a good explanation is available, brainstorm plausible alternatives that might fit the facts.
Availability	Decisions are based on what comes to mind most easily.	Following media reports of a notorious group, analysts label their group as similar.	Prominence of an idea is linked to its validity.	Use brainstorming or other techniques that expand ideas. (See "Select the first.")
Framing	The answer is strongly influenced by how the question is asked.	"How will we break up the group?" points to enforcement; "How will we reduce the harms this group creates?" suggests a wider range of tactics.	The way of asking the question has a track record of leading to success.	Make sure the decision-making group is diverse in background and experience. Invite in outsiders who might ask different questions

Make hypotheses explicit. The more explicit your team is about its assumptions, the more likely it can test its assumptions and avoid costly mistakes. Searching for alternative hypotheses helps reveal hidden assumptions (Step 21). It is much easier to find hidden assumptions when the group places two or more explanations in fair competition and the team engages in systematic searches for data that can falsify one or more of the explanations.

Debrief. Whether the intelligence operation was successful or not, and particularly when it was not, analysts and others involved should systematically go over the experience to document lessons learned.

READ MORE:

Richard Heuer. 2007. *Psychology of Intelligence Analysis*. Hauppauge, New York: Novinka Books.

Kim Rossmo. 2009. *Criminal Investigative Failures*. Boca Raton, Florida: CRC Books.

HEURISTIC	EXPLANATION	EXAMPLE	WORKS IF…	COUNTERMEASURES
Representa-tiveness	Base a judgment on another group that shares some characteristics.	Both groups dealing drugs leads to the conclusion that meth sellers operate like crack dealers.	The characteristic is important and genuinely diagnostic of the problem.	Keep in mind variation. Look for differences as well as similarities.
Identity	Big events must have big causes.	A multiple shooting suggests a planned attack by several shooters, when in fact one shooter acted impulsively when threatened.	The only causes possible are big.	Consider that small, perhaps seemingly inconsequential things, initiated the causal chain.
Correlation	Two events that occur close in time and space must be related.	Analysts conclude that two shootings in one neighborhood in one week are due to gang disputes.	The association has been established by research and it is strong.	Coincidence and randomness are always possible. Look for other evidence beside association.
Confirmation	Look only for evidence that supports a hypothesis.	Having decided that all members of a group come from one neighborhood, only evidence supporting this conclusion is examined.	Evidence in support contradicts all the alternative hypotheses.	Look for contradictory evidence. Consider evidence supporting alternative hypotheses (Step 21).

29 BE PRINCIPLED IN YOUR WORK

THE PUBLIC ARE OFTEN SKEPTICAL OF CLAIMS FOR THE UTILITY OF INTELLIGENCE ANALYSIS AND CONCERNED ABOUT threats it may pose to personal liberty and democratic values. Others in the police and public feel that it is useful, essential, and poses little threat to democracies or liberty. Examples can be found to support both sets of views. In short, police intelligence is controversial and the controversy will not be resolved any time soon.

Despite this, there can be consensus around specific issues. Most people would agree that certain police intelligence operations are useful and promote democratic values. Excellent examples of this are the directed deterrence projects, based on "Pulling Levers" (Step 26), that have been used across the United States to combat street group-related homicides and street drug dealing. These projects focus police attention on high-violence individuals and groups, and high-volume drug markets. Police implement these projects in collaboration with community groups, and can field them without threatening civil liberties. Focusing reduces the number of individuals brought under police scrutiny and community collaboration provides some transparency. And, it reduces crime.

Protecting individual liberties and constitutional principles is fundamental to policing. There is no debate over this. Because this is so important, it bears repeating, largely because there have been failures in the past to adhere to these standards. Such failures are not simply the fault of individuals; they are the failings of the agencies that employ the individuals. Agencies that rely heavily on law enforcement (and overlook alternatives), employ broad sweeping campaigns (instead of focusing on the most harmful people and places), and measure activities (rather than outcomes) facilitate such failures.

An important way to ensure that intelligence analysis lives up to high ethical standards is to focus on harmful target groups and measure success by outcomes. When success is measured by arrests, seizures, disrupted criminal organizations, and other means, then there is an incentive to produce arrests and seizures, and to announce that criminal groups have been fractured (whether they have been or not).

Shifting the focus to outcomes makes it easier to take the more principled path, but it does not guarantee ethical behavior. When we call for a focus on goals and outcomes we are not claiming that "the ends justify the means." But by stating that there are many means to select among, we are claiming that in most, if not all, circumstances there will be good means that can help achieve the ends desired; it is not a choice between effective bad means, and ineffective good means.

There are 10 principles that if followed will help assure ethical results. Except for the first, they are in no particular order. Indeed, they overlap and are mutually supporting.

1. **Reinforce democratic values.** Open discussion and debate is the foundation of democracy. Many of the principles that follow have their foundation in this principle. Conduct intelligence analysis in a manner that facilitates open discussion and debate. However, know that you cannot divulge all data. In fact, divulging some data will undermine democratic values. Still, to the extent possible, be open about information. Look for ways that allow for open discussion with the public that do not compromise individual liberties, sources of data, or methods for obtaining data. At the very minimum, do not use your position to undermine democratic institutions and processes.
2. **Tell the truth.** Better to say nothing than to give false reports. Though deceiving offenders can produce short-term gains, in the long term they learn about the deceptions. Importantly, the public is also likely to be deceived. In either case, gaining future cooperation from the public or from offenders becomes more difficult.
3. **Tell as much as possible.** You might not be able to tell all, but it is possible to tell much. You do not have to tell it all at one time; some information can be kept secret for a time. Definitely convey the uncertainty in the information shared with the public.

4. **Focus on behaviors, not characteristics.** As much of your intelligence is uncertain, protecting the anonymity of individuals is important. Focus on the behavior of groups, not the characteristics of their members. Do not generalize beyond the specific offenders in question. Do not hold individuals up for public ridicule.
5. **Demonstrate progress.** Focus on the harms done by groups and measure your progress by the reduction in these harms, not by your activities. Focusing on progress toward achieving goals reduces the need to discuss sources, methods, and other things that should be kept confidential. When you describe actions and activities, link them directly to goals and outcomes. Admit setbacks and explain them.
6. **Be truthful to yourself.** Conduct self-assessments of your work. When successful, discover why it worked and how it can be repeated. Acknowledge that some successes were due to good fortune, and may not be repeatable. When unsuccessful, find out why you did not succeed and what you can do to avoid repeats. Identify unforeseen circumstances that impeded success and determine how these can be addressed in the future.
7. **Recognize limits.** Acknowledge that when it comes to crime, all data is suspect, and this is even more the case when dealing with offender groups. Understand that as much as you think you know about a group, or your effect on the group, you probably do not know enough. Appreciate the limits of human cognition and develop ways to reduce their negative impact. Recognize that you are likely to be wrong and that humility is a requirement.
8. **Focus.** Police resources are scarce and the public is most concerned about broad use of police powers. For both reasons, target groups that produce the most harm. Use criminal justice sanctions precisely, and convey credible deterrent threats to group members. When seeking to address locations that facilitate group crimes, pick the exact places that aid the groups, rather than larger areas. Focusing not only expends fewer resources and poses less of a threat to civil liberties, but it is also the most effective approach.
9. **Be wary of false consensus.** The uncertainty inherent in understanding group criminal behavior means that it is highly unlikely that any group of police agents has a full understanding of what is going on. There will always be surprises. Consequently, it is important to create an environment that encourages new ideas, innovative ways of doing things, alternative view points, and dissenting opinions.
10. **Test ideas.** Hypothesis testing is seldom viewed as a moral imperative, but when the truth is uncertain and the stakes are high, it is critical that ideas be put to strong tests. A strong test seeks out information that could falsify the idea. Testing is quintessentially democratic, because it does not rely on the status of the person with the idea, or how many followers that idea has. The idea must survive assault by facts and logic.

30 DON'T UNNECESSARILY BEAT YOURSELF UP

WE HAVE REPEATEDLY ARGUED IN THIS MANUAL THAT ARRESTING GROUP MEMBERS IS RARELY ENOUGH to solve a crime problem and, in line with the principles of problem-oriented policing, you should work to change the conditions that make the group's crimes possible. However, we are not blind to the difficulties of doing this. Arresting offenders is seen as the prime duty of the police, and a clear legal and procedural framework exists to guide you. On the other hand, changing the facilitating conditions for crime is a much less familiar role for police and you can expect it to be resisted. Furthermore, compared with traditional policing, which has been around since the London Metropolitan Police was founded in 1829, experience in the use of problem-oriented policing is comparatively recent and you can expect its procedures to be less well-defined, if not outright murky.

Our manual has been written to help you, but you can expect to run into roadblocks of two kinds that can delay and discourage you. These are: (1) objections to the idea of reducing opportunities for offenders, and (2) difficulties of changing critical facilitating conditions.

Objections

The source of many objections you might encounter is **the fundamental attribution error**. Psychologists use this term to describe the human tendency to ignore the role of situation and environment in causing behavior. For psychologists, behavior results from the interaction between the organism and the environment. Translated for police, this means that crime results from the interaction of a motivated offender with a crime opportunity. Traditional policing focusses on "taking out" the offender from the equation, while problem-oriented policing seeks also to remove the opportunities for crime. The difficulty is that the public have little understanding that opportunities play a large part in causing crime. They think that crime is solely the result of immorality, selfishness, and greed. As a consequence, you will likely encounter many objections and even accusations as you seek to change the facilitating conditions for the problem you are addressing, such as these below:

1. **You are not doing your job.** That is to say, you are not arresting offenders and bringing them to justice. This argument may be made when you are trying to persuade some individuals—for example shopkeepers, apartment complex managers, owners of pubs and clubs—to change their premises or practices to make crime less likely to occur.
2. **You are blaming the victim and inconveniencing the law-abiding.** Those who accuse you of not doing your job might also claim that you are blaming them for the crime problem, and inconveniencing them with burdensome requirements, when all they are trying to do is run a successful business that provides a service to the public.
3. **You are ignoring displacement.** People tend to believe that offenders will always find a way to commit crime whatever the impediments thrown up against them. It is not only the public that believes this—many police do as well. But there is now ample evidence from research that displacement is a much less common result of reducing opportunities for crime than usually believed. You should be ready to counter the displacement argument by becoming familiar with *Analyzing Crime Displacement and Diffusion*, Problem-Solving Tool Guide No. 10.

Facilitating conditions may be too difficult to change

You can usually deal with the objections listed above through patient explanation (another skill required of those engaged in problem-oriented policing). However, your efforts to change facilitating conditions might run into a more intractable roadblock—some of these conditions just cannot be changed. We are not referring here to obvious facts of geography, such as the proximity to the Mexico border that facilitates

theft of cars for export. Instead, we are referring to the limits of local police to persuade key stakeholders to make changes. We identify three sources of these limits below, together with illustrative examples:

1. **Action is needed at regional or national levels.** For example, a facilitator of most varieties of car theft—whether joyriding, theft for resale, or theft for export overseas—is the lack of in-built vehicle security. Only in recent years has effective security, such as electronic ignition immobilizers and central door and window locking, been built-in at manufacture. But the vehicle fleet in the United States now averages more than 10 years in age and, assuming your jurisdiction is typical, most of the cars it encompasses provide easy pickings for thieves. In the long-run, this situation will change as manufacturers increasingly adopt more built-in security, perhaps in response to federal regulation or to meet public demand. Meanwhile, your hands are tied.
2. **Stakeholders may be unable or unwilling to act.** It might be thought that the best way to reduce theft for export to Mexico would be to tighten vehicle inspection at the border. Leaving aside that many stolen cars cross the border before they have been reported stolen, there are several reasons why this is difficult to achieve. First, border security is more heavily focused on incoming than outgoing traffic. Second, number plate recognition devices are prone to malfunction, so their warnings are often ignored. Third, increasing inspection times by just a minute or two will rapidly result in lengthy queues and unacceptable delays. Finally, organized thieves are well-practiced in deceiving hurried inspection procedures. Consequently, what seems to be an obvious and effective way to deal with the problem cannot be implemented.
3. **Changes are too expensive or too disruptive of business models.** Research has clearly shown that two clerks on duty in convenience stores, particularly at slow times, substantially reduce the risks of robbery. Nevertheless, legislation mandating this measure was strenuously resisted in Florida and elsewhere, on grounds that it was too costly. In fact, all businesses, from corner stores to national banks, always compare the costs of crime prevention with the costs of crimes that might be prevented. When the risks of crime are low, the businesses often prefer to run these risks and call in the police when a crime occurs. They may also resist a crime prevention measure when it requires them to make difficult changes in their usual operations. For example, new home builders in Charlotte resisted police advice, based on solid research, that site burglaries could be reduced if appliances were installed in new homes immediately before the purchasers took up residence rather than weeks before. This was because builders found it was administratively easier to arrange for appliances for a particular housing development to be delivered together and installed all that same time instead of arranging for them to be installed just before each house was occupied.

It may be problems such as these that undermine your problem-oriented policing project. But you should always remember there is never just one way to solve a problem. If you run into a roadblock, turn your attention to another key facilitating condition that you might be able to change. Who knows, you might therefore enjoy the considerable satisfaction of bringing about a lasting reduction in crime.

Part 2

Case Studies of Criminal Groups and Problem Gatherings

31 HOW TO READ THE CASE STUDIES

IN WRITING THIS MANUAL, WE DISCOVERED THAT WHEREAS CRIME ANALYSIS COVERS THE GENERALITY OF CRIME, intelligence analysis is mostly focused on offending by groups. We had not seen this point made before, but it soon arose in our discussions about intelligence analysis with police analysts—in fact, they mostly took the point for granted.

At first, we treated this idea as a hypothesis, but we gradually became more confident that it does indeed represent the reality of intelligence analysis, at least in the policing field. Consequently, we thought it important to test the idea by undertaking a closer study of a variety of groups and gatherings in order to learn more about:

1. The kinds of information needed to understand them sufficiently well to identify possible points of intervention for problem-oriented policing
2. The guidance provided by the literature about ways to analyze the information that might exist
3. The existing information on the range of measures that have been deployed by police and others to prevent the crimes committed, to apprehend the offenders, and generally to reduce the harms resulting from the actions of the groups and the activities associated with the gatherings

For these purposes, we did not have to cover every kind of criminal organization and problem gathering; indeed, it would have been impossible to do so in the limits of time and pages available. Rather, we sought to include a variety of groups and gatherings, some familiar (e.g., street gangs, retail drug dealers, and street racing) and some less so (Internet pedophile rings, organized insurance fraudsters, and animal rights extremists). In making our selections, we chose not to include groups and gatherings for which published information was sparse. The first eleven case studies describe a wide variety of crime groups and the final five case studies describe a diverse selection of problem gatherings.

While our original objective in assembling this information was to test the ideas we present in the body of the manual, we thought it could be helpful to present summaries of the assembled information in the form of the case studies. If you happen to be dealing with any of the groups or gatherings included here, you might find the relevant case studies to be of direct value in your own intelligence work. More generally useful to you, however, might be the examples they provide of the kinds of intelligence that could be collected for other groups and gatherings, and the kinds of preventive interventions that might be considered. This would be the main benefit of looking through all the case studies once you have finished reading the body of the text.

The goal of these case studies is to provide a general way of approaching criminal groups, rather than provide an encyclopedia of what is known and unknown. This can change rather swiftly, and there is some debate over a number of issues. At the end of each case, we provide a few readings. These are the sources we found most useful. We choose not to provide detailed citations to all the things written on each group. If you find yourself directly addressing one of the types of groups in these case studies, you should do additional research to come up with useful approaches. *Researching a Problem*, one of the Guides from the Center for Problem-Oriented Policing, could help you get started.

The case studies were mostly written by our colleague, Gohar Petrossian. They follow a reasonably standard format adjusted somewhat to the topic and to the available information. They begin with a general overview of the problem, followed by the discussion of the facilitating conditions or factors promoting the problem. Some case studies include sections explaining how these groups are organized. Examples of domestic or international response strategies are presented either in the body of the text or in separate boxes. Lastly, suggestions as to what you might contribute as an intelligence analyst and what your agency can do are provided at the end of each case study. Be aware that these examples are not intended to be exhaustive and, unfortunately, few have been rigorously evaluated. They are included merely to help you and your agency get started!

32 RETAIL DRUG DEALERS

MANY, PERHAPS MOST, POLICE IN THE UNITED STATES HAVE GROUPS OF DRUG DEALERS OPERATING ILLICITLY in their city. The variety of drugs sold makes it difficult to describe the role of intelligence in addressing local drug markets, and we will stick to some broad principles that must be adapted to your local conditions.

Forms of retail drug dealing

Drug markets are where the supply of drugs meets the demand for drugs. They are of two general types:

- **Closed markets.** These operate through social networks. To buy drugs you must know a seller in the network who trusts you, or you need someone who knows a seller. The advantage to all participants is that closed markets offer security from the police, and from robbery by other offenders. For buyers, they can also provide some assurance of product quality because information circulates among the insiders who routinely interact with each other.
- **Open markets.** Participants in these markets may not know each other. Street markets tend to be geographically fixed so that customers can find them. For sellers, the advantage is that they can get more customers, but there are major risks from police and from robbery. Open markets tend to be more violent than closed markets because they are less secure. Open markets can become convergent settings (Step 12) and thereby foster criminal activity in their surroundings.

Open markets are a much more serious problem for communities than are closed markets: not only are they more violent, but they cater to larger numbers of people and they are more visible to the public.

What are the facilitating conditions?

- **Consumers.** A relatively few high-volume consumers and many small-time users are needed.
- **Supply.** The dealer must be connected with people who can supply drugs. Suppliers are often organized in a "cottage industry" style where small groups form and disband as necessary. They may travel from small cities to larger metropolitan areas to secure drugs to supply their local dealers. Such suppliers are easily replaced.
- **Financing.** There are two ways drug dealing can be financed:
  1. The dealer uses his own money to purchase drugs. The supplier gets paid up front and the dealer pockets the proceeds from the sales. Small-scale operations can function this way.
  2. The supplier provides the drugs on credit, and the dealer pays him back from the proceeds. This requires either trust or an enforcement mechanism. This increases the risks of violence.

Though these are the dominant financing arrangements, others are possible. For example, a dealer might provide enforcement services to a supplier in exchange for drugs, or pay for drugs with stolen goods or firearms.

- **Social networks of buyers and sellers.** For closed markets the minimal requirement is a social network of individuals, some of whom want drugs and others who have drugs to sell. This may be the dominant form of drug sales as it has the fewest requirements.
- **Neighborhoods.** Open drug markets require locations that are easily accessible to customers and where their operations will not be disrupted by property owners. Low-income neighborhoods are ideal locations because much of the property is owned by absentee landlords who have little incentive to intervene because of the low economic return on their properties. Once established, drug sellers tend to congregate near each other, just like legitimate businesses, if the area suitable for drug dealing is big enough to accommodate them without conflict.

- **Streets.** Large open markets need ready access to customers. So these tend to be on or near major arterial routes or highways, within vulnerable neighborhoods. Street patterns that permit circular cruising give customers the ability to locate dealers quickly and leave.
- **Places.** These are open markets where people can legitimately hang out and where owners will not interfere. Corner convenience stores are useful because dealers and customers can blend in. Nearby rental apartments where landlords are not scrupulous about tenant management provide locations for stashing drugs, meeting suppliers, and resting places. Lax place management is critical in all circumstances.

What is being done?

There has been a shift in attention from policing drug networks to policing drug places. The rise of hot spots policing has led to intensive patrolling of small areas with high crime concentrations. If these concentrations are close to drug markets, the markets suffer from these patrols. Problem-oriented approaches have been found to be effective in suppressing open drug markets, and superior to hot spots policing alone. Most successful problem solving has engaged the owners of properties—landlords, retailers, bar owners, and so forth—in making their locations unsuitable for dealing. Typically, these place managers cooperate. But when they do not, public pressure and the threat of civil sanctions can be helpful. Many landlords are woefully ignorant about crime and drug dealing, so landlord training can be helpful.

Street closures and other traffic manipulations can also be helpful in specific circumstances. When dealers and users take advantage of easy access to market sites, then altering traffic flow by changing street access can be helpful.

What can you do?

Differentiate between open and closed markets, but recognize that some markets may use aspects of each.

Keep a current list of open and closed markets in your area.

Rank markets by the three Vs:

- Violence—killings, shootings, and assaults
- Volume—number of dealers, sellers, and transactions
- Visibility—how noticeable to the public

Determine how dealers in the most problematic markets either finance their supplies or get protection for their operations.

Know who the dealers are and who they associate with.

For open markets you could identify places critical for market operation and their owners/managers; study street patterns that allow buyers to meet sellers; or identify facilitating conditions that can be altered at the place, street, and in the immediate area.

For closed markets you could gather intelligence on how these develop and interact; and identify those which are most problematic using the three Vs—violence, volume, visibility.

What can your agency do?

Set priorities. Put high-violence markets (usually open markets) at the top of the list for closing down.

Drive illicit drug use underground. Drug dealing cannot be eliminated, but it can be reduced. Displacing open markets to closed can reduce each of the three Vs: violence, volume, and visibility.

Engage place owners. Involve owners and managers of locations at risk of drug dealing. This will include apartment owners and managers, bar owners and employees, entertainment venue owners and employees, and others.

Address street patterns and traffic flow. Alter street patterns that assist open drug dealing. Gain the active participation of local residents and businesses to minimize collateral damage to legitimate activities.

Communicate directly with the dealers. Creating a credible direct deterrent threat to dealers has been shown to reduce open drug dealing. This approach operates very much like "pulling levers" (Step 26).

33 TERRORISTS

UNTIL 2001, YOUR CHIEF MIGHT RARELY HAVE THOUGHT ABOUT THE THREAT OF TERRORISM, but 9/11 changed that. However remote the threat of an attack may be, the consequences can be so horrific that police must now spend precious resources on prevention and preparation.

Apart from being an act of unparalleled evil, 9/11 was unusual because its perpetrators were foreign terrorists. This might have signaled an increase in foreign attacks, though until then the great majority of attacks had been perpetrated by domestic terrorists, such as eco-terrorists, anti-abortionists, hate groups, and militias. The most lethal attack by domestic terrorists was the 1995 car bombing of the federal building in Oklahoma by Timothy McVeigh.

Domestic terrorists have not been able to conduct repeated attacks, with the relatively minor exceptions in the 1960s of the black power movement, and the bombings carried out by the Puerto Rican Liberation movements in the 1960s and 1970s. Could repeated terrorist attacks again happen here? These are some possible sources of risk:

- A long history of violence among Latino and other gangs in large U.S. cities, some of whom are composed of former paramilitary extremists such as the Mara Salvatrucha deriving from El Salvador.
- Deportation of illegal immigrant gang members back to their home country, thus creating the opportunities to establish international networks.
- Existence of well-established immigrant communities that provide cultural cover for potential terrorists.

What can your department do to avert an attack?

The most important things to do are to strengthen community policing, particularly of immigrant communities, and develop links with fusion centers and the FBI Joint Terrorism Task Force.

What can you do, as an intelligence analyst, to support your chief? You should:

- Learn about terrorism so that you know what kind of intelligence to assemble. Start with *Policing Terrorism*, listed in "Read more." (Since terrorism myths abound, *Myths about terrorism* on page 92 includes those discussed in *Policing Terrorism*.)
- While accepting that the risk of attack for most cities is very low, try to determine which factors could increase the risk for your city (see Brief 8 in *Policing Terrorism*).
- Develop local intelligence by analyzing reports from police officers, particularly community officers in areas where potential terrorists might feel comfortable, and from businesses such as motels, banks, and car rental agencies (see Step 16). The San Diego Police Department routinely monitors reports of the theft of propane canisters from suppliers and e-mails the information to its investigators and analysts.
- Identify possible targets for attack in your jurisdiction. Begin by drawing up three lists:
  1. A short list of the most obvious targets to be protected as soon as possible. (For guidance, see Briefs 29 and 30 of *Policing Terrorism*.)
  2. A prioritized list of other targets that require extensive target hardening and a timetable for ensuring that this is done.
  3. A longer list of all possible targets that should be protected by some basic target hardening measures that your department should work to get put in place.

READ MORE:

Graeme Newman and Ronald Clarke. 2008. *Policing Terrorism: An Executive's Guide*. Washington D.C.: U.S. Department of Justice, Office of Community Oriented Policing Services.

Myths about terrorism

1. *Anyone might be a terrorist.* A white-haired grandmother from the Midwest, even if behaving suspiciously, is very unlikely to be a terrorist. More likely is that she is confused or ignorant of the rules, and that should be the assumption when police approach her. They should reserve their suspicions for those who most closely fit the terrorist profile.
2. *Every immigrant is suspect.* Those who fit the terrorist profile best (for the present at least) are young male immigrants of Arab appearance. Among this group, only a tiny minority are wannabe terrorists or even terrorist sympathizers. Assume in your dealings with immigrant groups that they are as opposed to terrorism as anyone else.
3. *Terrorists are crazed fanatics.* However much we disagree with their reasoning and condemn their cruelty, cold rationality guides much of their behavior. Like all organized criminals, they carefully plan their acts, they try to avoid being caught, and they are determined to succeed.
4. *Terrorists are eager to die.* As we know, some terrorists are willing to die for their cause, but many are careful with their lives. They have the same ambitions for success and happiness as everyone else, and they would prefer to escape and strike again rather than fail and die.
5. *Terrorists are evil geniuses.* Not every terrorist has the mind attributed to Osama bin Laden. Most are ordinary, fallible individuals. They might carefully plan their acts, but they cannot anticipate every eventuality and they will be forced to improvise and take chances. This will sometimes result in failure and perhaps in being killed.
6. *Terrorists might strike anywhere.* Only in theory they might; in practice they must conserve their resources and strike for the greatest effect. If we think like terrorists we can anticipate their choices and act accordingly to protect the most vulnerable targets.
7. *Terrorists are unstoppable.* Most groups of terrorists last only one or two years before falling apart. There are also many examples of terrorism being substantially reduced. For example, the Israelis have reduced suicide bombings by installing border fences.
8. *We can win the war on terrorism.* We can hinder the terrorists and make them less successful, but we can never eliminate terrorism from our world. That is about as unlikely as winning the war on crime.
9. *If it can happen in London (Israel, Delhi…), it can happen here.* Do not assume that a form of terrorism that occurs overseas can easily be reproduced here. Each form of terrorism depends crucially on the opportunities provided by the environment in which it is committed. This environment is rarely the same from country to country. For example, the routine suicide bombings that used to be committed in Israel were made possible by the close proximity of Palestine, the relative ease of entering Israel, and the steady supply of willing bombers. Such conditions do not exist here.
10. *We must prepare for nuclear attack.* Most experts agree that the logistics of building or stealing, and delivering a nuclear bomb make it unlikely terrorists would attack us in this way. Planting a "suitcase bomb" (a radiological dispersal device) in any of our large cities would be much easier. That this would lead to mass casualties is unlikely, though it might result in widespread panic.
11. *Fighting terrorism is a job for the feds.* The FBI and the CIA cannot defeat terrorism on their own. They must garner the support of the public, the private sector, and above all, police agencies. Local police have a key role in gathering intelligence about terrorists, in helping to protect vulnerable targets, and in responding to any attack.
12. *Sharing intelligence is the key to defeating terrorism.* However much we improve intelligence we could never rely on it alone. We also need systematically to reduce the opportunities for terrorism by protecting the most vulnerable targets. Local police might be excused for failing to unearth a terror plot; but there is no excuse for failing to protect key targets or fumbling the response in the event of an attack.

34 WHITE SUPREMACISTS

MEMBERS OF WHITE SUPREMACIST GROUPS BELIEVE THAT WHITES SHOULD DOMINATE SOCIETY because they are superior to other races. They hold in contempt not only other races, ethnicities, and non-protestant religions, but also gays and lesbians. Sometimes they commit hate crimes against these groups. They share a common ideological focus to clean up "cultural pollution" in the United States.

Group members tend to be middle-aged males, average in terms of income, occupation, and level of education. Since 9/11, some white supremacist groups have actively sought to recruit current and former members of the U.S. Armed Services in order to exploit their access to restricted areas and intelligence, or to apply their specialized training in weapons, tactics, and organizational skills.

More than 500 white supremacist groups are thought to exist in the United States, with an overall membership of 100,000 to 200,000. They publish more than 50 periodicals and have established about 2,000 different hate sites on the Internet. They now increasingly rely on the Internet to express their views, recruit new members, and sell their products. Five main groups of white supremacists are as follows:

1. **The Identity Church** incorporates some of the most active and violent organizations, including "Aryan Nations," "Covenant and Sword," and "Arm of the Lord." They seek to justify their racist and anti-Semitic beliefs in a scriptural reading that posits white Christians as God's "chosen" people. They see Jews, defined as non-white, as the greatest enemy, whose ultimate plan is to "race mix" the white race out of existence by brainwashing white women into the arms of black men. On the other hand, they view Blacks as "pre-adamic," a race incapable of creativity and intellectual labor and of constructing a "civilization" or "culture." Followers of the Identity Church ideology believe in the inevitability of a global war between races, which they see as the only way to create a white homeland.
2. **Neo-Nazis** such as the "National Socialist White People's Party" and the "National Alliance," use tracts of Germany's Third Reich to inform their "Americanism" and "White-power" rhetoric.
3. **Skinheads** share neo-Nazi rhetoric and ideology in a somewhat less orderly and consistent manner. According to the Anti-Defamation League (www.adl.org), their numbers may be increasing. They tend to be younger, more loosely organized, but also more violent than some other hate groups.
4. The **Ku Klux Klan**, though once powerful and prominent, is currently in a state of fragmentation. In its contemporary form, it addresses problems like AIDS, crime, welfare, or immigration "solely through the prism of race and offers not solutions but a license to hate." (June A. Marlin. 1992. *Klan's Invisible Empire is Alive and Active in Northeast*. Available at http://alb.merlinone.net/mweb/wmsql.wm.request?oneimage&imageid=5618828.)
5. The ***Posse Comitatus*** (Latin for 'power of the county') shares the anti-Semitism of other hate groups, alongside the anti-statism of the militia groups. The only legitimate form of government for the Posse Comitatus exists at the local level, since the federal government is dominated by Jewish financial interests.

Conditions that promote the emergence of white supremacist groups or facilitate their actions

Such conditions include the following:

- Uncertain economic times, farm crises, and perceived threats to rural industries
- Social changes, such as the rise of the women's movement, the civil rights movement, and gay and lesbian movements
- High rates of non-white immigration
- A volatile political atmosphere, such as that surrounding the wars in Iraq and Afghanistan
- The election, in 2008, of America's first African American president

- The existence of radical churches in rural states
- Lax gun controls in these states
- Internet providers that tolerate hate messages on web pages

It is immediately obvious that very little can be done to change these societal conditions, although the House of Representatives passed the Local Law Enforcement Hate Crimes Prevention Act 2007 to provide federal assistance to state and local jurisdictions to prosecute hate crimes. In fact, local and state police are perhaps in the best position to take action against such groups.

What can you do?

Learn about hate groups and identify those active in your area. Gather intelligence about their ideologies and their backgrounds, and identify possible targets of these groups.

Gather intelligence about the leaders of the hate groups. Where legal grounds for arrest exist, removing the leader will significantly impact the functional capability of the group.

Use analysis to identify possible target locations and select areas at risk. Inform your department about possible future attacks.

Identify and monitor websites operated by hate groups active in your jurisdiction.

Study the *modus operandi* in hate crimes. This may help prevent future attacks on similar targets.

What can your agency do?

Form a task force trained to recognize and properly respond to hate crime if and when it occurs in your jurisdiction.

Warn the leaders of organizations targeted by hate groups to watch out for possible signs of hate crimes and encourage them to contact your agency if alarmed.

Encourage the community to report hate crimes and employ its assistance in investigating and responding to hate crime incidents, and in apprehending the perpetrators.

Seek help from state and federal law enforcement if the groups' operational outreach is beyond your jurisdiction and more sophisticated investigative tools are necessary to support your current operations.

Identify and disrupt any gatherings that use racial slogans, anti-Semitic themes, or any other white supremacist ideology to carry out their activities and recruit new members.

Identify and remove (if possible) the possible financial sources of these groups.

Four characteristics of enduring white supremacist groups

1. Strong leaders with a clear ideological agenda as, for example, in the cases of the Aryan Nations and the National Alliance.
2. Consistent pursuit of activities to expand their goals and acquire the necessary finances. Most groups have perpetrated serious crimes on a regular basis, which has contributed to group stability.
3. Strategic advantage taken of political opportunities. The broader political atmosphere feeds these groups with the opportunities to further their ideologies.
4. Internal cohesion. Organizational instability is seen as a major threat to the survival of these groups. This can result from conflict among its leaders, loss/removal of leadership or the inner core, and the loss of funds.

Source: Freilich, Chermak, and Caspi 2009.

Operation Lone Wolf

In 1998, the San Diego P.D. began to investigate a hate crime case where several prominent members of the community and religious locations were targeted. The two-year investigation resulted in the arrest and prosecution of Alex Curtis, a well-known white supremacist leader. Curtis had been involved for many years in promoting and fostering racial violence through his website, telephone hotlines, and newspaper (*The Nationalist Observer*). He targeted businesses owned and operated by Jewish people, as well as elected officials or known public figures who either openly spoke against white supremacist activities, or who helped minorities. The investigation also led to the arrest of Curtis' cell members. Following the arrests, San Diego experienced a dramatic decrease in hate crimes.

35 ANIMAL RIGHTS EXTREMISTS

ANIMAL RIGHTS EXTREMISTS, AND MEMBERS OF GROUPS ENGAGED IN THIS KIND OF CRIMINAL ACTIVITY, are generally young to middle-aged, white, and well-educated. Thus, they draw from the same pool of individuals who are attracted to organizations that work peacefully for animal rights, such as Greenpeace, the Wilderness Society, and People for the Ethical Treatment of Animals.

SHAC (Stop Huntingdon Animal Cruelty) is an extremist animal rights group. In 1999, it almost succeeded in shutting down Huntingdon Life Sciences, a British company that conducts product safety testing on animals. SHAC employed a combination of intimidation and violent protests and, since then, extremist groups have become increasingly violent and are said to have caused millions of dollars' worth of damage.

How are they organized?

The best-known animal rights extremist group is the Animal Liberation Front (ALF). It was established in Great Britain in the 1970s as an outgrowth of groups such as Greenpeace and the Sea Shepherd Conservation Society. It consists of an unknown number of individual cells made up of a few people who act autonomously. The activists remain largely anonymous to both the public and each other, which is done purposefully to maximize the security and fluidity of the movement. The ALF operates in more than a dozen countries, including France, New Zealand, Poland, Italy, and Slovakia.

Apart from this group, other lesser-known groups have claimed responsibility for criminal actions in defense of animals. These include the Animal Rights Militia; the Justice Department,[1] a UK-based extremist group; Bakers for Animal Liberation; Guerilla Advertising Contingent; Kangaroo Wilderness Defense; the Lawn Liberation Front; and Pirates for Animal Liberation. The Animal Rights Militia, the Justice Department, and SHAC have been especially active and violent in both the United States and Great Britain in recent years.

1. The Justice Department is an extreme animal rights group based in the United Kingdom. See: Anti-Defamation League. 2010. "Justice Department Claims Responsibility for Threats Against UCLA Animal Researcher." December 3.

What criminal activity are these groups engaged in?

Researchers have classified the criminal activities of these groups into four groups:

- *Type I* commit minor crimes, involving little property damage, which may include such acts as civil disobedience, hanging banners, spray painting slogans, and smashing windows.
- *Type II* commit significant acts of property damage, including setting fire to research laboratories and using firebombs or incendiary devices.
- *Type III* engage in threatening behavior directed against people, including bomb hoaxes, e-mail threats, harassing phone calls, splashing people with red paint, pelting people with tofu pies, leaving dead animals on dinner plates, etc.
- *Type IV* make physical attacks against persons, including beatings and bombings.

Who and what is at risk?

The locations most at risk include federal research facilities, universities, factory farming operations, furriers, and fast-food restaurants. The groups use stolen footage from labs to create publicity materials and films. Research scientists, corporate officials, and their families are at heightened risk of being threatened or assaulted.

The groups use three forms of attack: (a) primary targeting, which can involve visits to the homes of those directly involved in using animals and delivering threats or violence; (b) secondary targeting that involves attacks on companies doing business with animal-related institutions, such as banks; and (c) tertiary targeting that involves harassing the customers or workers of these companies because they are doing business with animal-related institutions.

In the 1990s, Operation Bite Back and Operation Bite Back III, multistage campaigns led by the ALF, included the release of more than 10,000 mink from the Arritola Mink Farm in Mt. Angel, Oregon—the largest number of animals released to that time. These and other actions by the ALF led to legislation, including the federal Animal Enterprise Protection Act (1992), which criminalized causing more than $10,000 in damages at commercial and academic institutions that use animals.

Examples of action taken against extremists

The National Association for Biomedical Research (NABR) developed a coalition for research groups and pushed for the passage of the Animal Enterprise Terrorism Act in 2006. The Act is designed to protect enterprises and researchers who are engaged in animal-related research from the forceful, violent, and threatening acts of animal rights extremists. The Act protects not only primary, but also secondary parties, such as suppliers, from harassment, intimidation, threat, and violence.

California has been a prime target for animal activist attacks in the United States and has passed laws to address the problem. In 2008, for example, former Assemblyman Gene Mullin led an effort to pass the Researcher Protection Act, which made it a misdemeanor to publish personal information about researchers or their families, "with the intent that another person imminently uses the information to commit a crime involving violence or a threat of violence against the academic researcher or his or her immediate family member." The Act also outlaws entering the property of academic researchers to intimidate them and to cause them to stop their work.

Cedars-Sinai Medical Center in Los Angeles is one of many institutions that have adopted a variety of security measures. In addition to carefully screening employees before they are hired, these measures include changing the location of the research facility from the ground floor to a higher floor, instituting strict access controls (researchers can only enter the facility by using electronic key cards), and controlling the elevators by using security guards with key-cards for access.

The research community at large has undertaken public outreach to help people understand that animal research is necessary for medical progress and is heavily regulated by the government.

What promotes animal rights extremism?

- The existence of medical, university, or pharmaceutical research facilities that conduct experiments on animals
- Absence of laws protecting researchers and research institutions
- "Factory farming" operations
- Financial support given to these extremist groups by animal lovers

What can you do?

Collect intelligence on the most active groups and members within these groups through their websites and other sources. Determine if any of these groups are active in your jurisdiction or nearby.

Monitor their websites to identify any material used to threaten or frighten their intended victims.

Identify the methods and technology used by these groups to attack their victims.

Determine which type of criminal activity (refer to the four types discussed above) each group is likely to be engaged in (or has historically engaged in) and devise prevention strategies accordingly.

What can your agency do if extremists pose a threat?

Raise awareness about these groups through community meetings and publicity. Inform the public about the methods and technology used by these groups to attack their targets.

Encourage institutions or people most at risk to report any threat, harassment, or intimidation they may experience from animal rights extremist groups.

Inform these potential targets of security measures and responses that they can develop to protect themselves from current or future attacks, intimidation, or harassment.

Advocate legislative changes to control the criminal activities of these groups.

Control or limit any demonstrations that may result in criminal activity by these groups. Coordinate response strategies with other criminal justice agencies or agencies in nearby jurisdictions.

Support any efforts of the local research community to raise awareness about the importance of medical research.

Urge animal lovers not to give money to these extremist groups by informing them about the harms suffered by victims who are attacked.

36 INTERNET PEDOPHILE RINGS

PEDOPHILIA IS CLASSIFIED AS A MENTAL DISORDER AND IS DEFINED BY AN INTENSE DESIRE TO ENGAGE IN SEXUAL ACTIVITY with prepubescent children. However, many pedophiles claim that there is nothing abnormal about sexual activity between adults and children. These days, many pedophile rings operate and spread through the Internet. These include Candyman, Shangri-La, Girls 12–16, and Innocent Images, with a combined membership of many thousands.

Pedophile rings engage in a variety of activities, including:

- **The production and distribution of child pornography**, which is used not only for sexual stimulation and gratification, but also to assist in the seduction of a child, to lower the child's inhibitions, and to show what the offender wants the child to do. This is known as "grooming." Some pedophiles keep pictures of their sexual activity with children. These can be used to either pressure the child to remain silent about the activity, to exchange with other collectors, or to establish bona fides when making contact with other group members.
- **Distribution of information** about past or present child victims, access routes to vulnerable children, possible victim locations—such as special schools and hostels—methods and tips on grooming, and information on other pedophiles engaged in organized sexual abuse of children. Many different ways exist of distributing these materials, including e-groups, newsgroups, chat rooms, bulletin board systems, e-mail, websites, and peer-to-peer networks. Predators also use Internet social networking sites, such as MySpace, Twitter, and Facebook, to locate minors, and they can also use the Internet to carry out "live" chats with potential victims and to have "virtual sex" with the children.
- **Support groups** to promote such goals as "sexual liberation for all persons." The most prominent of the U.S. support groups is the North American Man/Boy Love Association (NAMBLA), but others include the Childhood Sensuality Circle, Pedophiliacs Anonymous, and Pedophile Information Exchange. They prepare materials and newsletters advocating legalization of sexual relations between adults and children. They serve to justify pedophilia in the members' minds and reinforce the belief that society, not the pedophile, is misguided.
- **Financial profit.** In many cases, the websites sell child pornography and can realize substantial profits for the operators. People involved in selling child pornography can be either pedophiles themselves, or people who are not sexually attracted to children but rather are motivated solely by financial gain.

What facilitates Internet child pornography rings?

- Lack of legal regulation of the Internet
- Cross-jurisdictional differences in laws and regulations regarding child pornography on the Internet
- Lack of law enforcement knowledge about the Internet
- The extensive possibilities the Internet provides to hide the users' identities
- The international operations of many of the pedophile rings
- The sophistication and availability of technology (e.g., mobile phones with cameras) that enhances the pedophiles' activities on and off the Internet
- The volume of Internet daily activity that makes it impossible to track every site and every person visiting these sites
- The affordability and ease of creating and operating new websites (operators can easily shut down a website that the police are investigating and open a new one)

- Pedophile rings that are knowledgeable about security measures, which can be employed to avoid detection. (Internet sting operations may have succeeded only in catching inexperienced operators)
- The historic reluctance of Internet Service Providers (ISPs) to monitor and censor content
- The reluctance of many victims (and their families) to report abuse
- A widespread perception that child abuse is committed by strangers, not by friends or relations
- The reluctance of parents to monitor their children's computer use
- The existence of pedophile support groups that encourage/justify such activities

Examples of actions taken against Internet child pornography rings

Police sting operations have identified and removed online pedophile rings. For example, Operation PIN, which established a "honeypot" website claiming to offer child pornography, involved the police from Australia, Canada, the U.K., and the United States. As the browsers clicked through screens warning of the explicit nature of the content, they came to a screen that announced that their attempt to obtain online child pornography had been traced and would be reported to local police.

In the United States, ISPs are legally required to report known illegal activity on their sites, but they are not required to search actively for such sites. Police may apply for a court order to seize ISP accounts. Microsoft has announced the development of the Child Exploitation Tracking System that links information, such as credit card purchases, Internet chat room messages, and conviction histories.

Some non-profit organizations seek to raise public awareness about Internet child pornography and will act as political lobby groups. These groups include Wired Safety and Safeguarding Our Children-United Mothers.

The National Center for Missing and Exploited Children operates a CyberTipline that allows parents and children to report child pornography and other incidents of sexual exploitation of children.

What can you do?

Cooperate with your department specialists in Internet crime. They know how to access encrypted sites and e-mails, which may be necessary for gathering intelligence about these groups.

Monitor the activities of child pornography groups, newsgroups, websites, and chat rooms. Postings on these sites for other pedophiles can be used to gather intelligence about online and off-line activities. For example, some sites list member's e-mail addresses to encourage private communication. This information can be used, instead, to gather intelligence and launch an investigation.

What can your agency do?

Authorize officers to enter pedophile newsgroups, chat rooms, or P2P networks posing as pedophiles and request child pornography images from others in the group. They can also enter child or teen groups posing as children and engage pedophiles who may send pornography or suggest a meeting.

In 1996, the San Jose (California) P.D. investigated a complaint against a man who had sexually molested and photographed a 10-year-old girl at a children's party given by his adult daughter in her home. The images were later transmitted via the Internet to members of what turned out to be the Orchid Club. The investigation into that club extended to a number of countries, including the U.K. Examination of the offender's computer uncovered links to the Wonderland Club, another covert pedophile group that used password protection and encryption to hide their activities. The case led to a worldwide investigation of members of both clubs, as well as to the discovery of a third club, the Roundtable.

Source: Associated Press. 1998. "Disgrace follows child porn bust." November 7.

Establish a well-publicized e-mail "hot line," which can be used to report any indications of distribution of child pornography.

Set up a "honey trap site" that purports to contain child pornography, which can be used to capture the IP address or credit card details of visitors trying to download images.

Involve the local community, which can help in raising awareness about the problem, as well as coming forward with information that may assist in arresting and prosecuting perpetrators.

Cooperate with local non-profit organizations in raising awareness about these groups through visits to local schools and youth centers.

37 GRAFFITI CREWS

HARDLY ANY AMERICAN CITY IS ENTIRELY FREE OF GRAFFITI, MOST OF WHICH IS GANG-RELATED, HATE-INSPIRED, or simply vandalism. Much less common is "art graffiti," where the motive is to create a startling or even beautiful decoration on a publicly visible surface, such as the side of the building. Since this is done without the owner's consent, the graffiti shows the artist's daring and contempt for the law.

Art graffiti is often committed by organized groups or "crews." Most members are males aged 8–19, most are poor, and they come from a variety of ethnic backgrounds.

Crews choose highly visible sites for their graffiti, such as subway routes, rooftops, freeway walls, billboards, and bridges. They prefer sites that involve some element of risk and that will be seen by other crews. They sometimes choose locations, "walls of fame," near other writers' tags to achieve a symbolic co-presence with them. They might write compliments near well-executed pieces or cross out ("dis") or paint over ("go over") poor works.

To increase their status, graffiti crews may "go citywide" or might "tag the heavens" by writing on tall buildings. They often work at night, which gives them time to cover a greater area. They prefer the cold winter months, because the nights are longer, fewer police and others are about, and overcoats allow spray-cans to be easily concealed.

Graffiti crews sometimes engage in shoplifting, handling stolen goods, marijuana use, and drinking in public. They rarely belong to street gangs, but may be recruited by gangs to develop a tag for gang clothing, to mark the gang's territory, or to paint "Rest in Peace" murals for those who have died on the streets. In return, the taggers gain protection from the gang and are sometimes rewarded with drugs.

A tag is the writer's name or alias, or the name of the crew to which he belongs. Each writer tries to develop a distinctive tag that allows him to "get up" or be recognized by other graffiti artists.

Crews create more complex forms, called "throw-ups" and "pieces" or "murals." Throw-ups are generally multicolored and use large "bubble" or sausage-shaped letters. They may include personal symbols or tiny self-portraits. Pieces or murals are large-scale, multi-colored features that may include human figures, animals, and urban structures.

How are crews organized?

Crews range in size from as few as three to as many as several dozen individuals. They are formed for companionship and for undertaking pieces in difficult to reach locations or that entail risky and time consuming work. While crews have no formal hierarchy, members will take responsibility for certain tasks, depending on their standing in the group. Some work mopping up, filling in the colors, and serving as lookouts, while others write the pieces.

In addition to tagging or "piecing" together, crews may hold regular "art sessions" to work on collective designs, share the "piecebooks" in which they draw their designs, and hone their talents to create future large pieces.

Crews might make contact with other crews by going to "writers' corners," which are locations where they can meet established writers, exchange ideas, and, sometimes go out and hit together. Generally these writers' corners move around as a response to police crackdowns and increased surveillance.

Why become a graffiti artist?

- "Getting up" satisfies a need for recognition and respect. Belonging to a graffiti crew also provides a medium through which artists 'communicate' with each other
- A desire to "escape real life" through creating a new name and establishing a new identity—thus becoming a different person
- The illegal nature of the act provides excitement and re-affirms masculinity

In an article originally published in *Security Journal,* George Kelling of "Broken Windows" fame, documented the successful program to rid the New York City subway of the notorious graffiti that blanketed the trains in the 1970s and early 1980s. After years of failed initiatives, the subway management adopted a fresh approach: once a car had been cleaned of graffiti it would be taken out of service and cleaned again as soon as it attracted any fresh graffiti. This removed the incentive for graffiti writers to "get up" and eventually led to the elimination of the problem.

What facilitates art graffiti?

- The proliferation of graffiti websites that provide advice and information
- Widespread availability of spray paint and other graffiti aids, including those found on the Internet
- Difficulties of apprehending and successfully prosecuting graffiti artists
- Widespread public ambivalence about the seriousness of the problem, often promoted by social commentators who may praise the activity

Examples of what has been done to address the problem

- Police and citizen surveillance teams have staked out popular graffiti-writing areas using two-way radios, home video cameras, and night vision goggles.
- Freeway signs and bridges have been secured with razor wire, and buildings protected with graffiti-resistant coatings.
- Graffiti hotlines have been established and undercover transit and police officers have been deployed in the guise of high-school students and journalists.
- High school "bounty hunters" and others have been given monetary rewards for turning in writers.
- So-called "coercive" crime prevention has been used, involving curfews from late night until sunrise (on those under the age of 18), high levels of surveillance of public areas, and extensive rules of entry and behavior in such places as shopping centers and malls.
- Writer's parents have been arrested on charges of contributing to the delinquency of minors and have been billed for thousands of dollars in damages.
- Access to spray paint and other graffiti-writing materials has been curtailed by making it a misdemeanor to sell them (the availability of these materials on the Internet could limit the value of this approach).
- Rapid cleanup has been used to deny crews the reward of having their work seen by others, thus removing the incentive for putting up graffiti (see the text boxes in this step).
- The community has been enlisted in campaigns to combat graffiti by education, community watches, beautification programs, and "paint-outs."

How can you help your agency?

A wide repertoire of measures can be deployed against graffiti crews and you can best assist your department by identifying those most appropriate for your jurisdiction. Specifically, you could:

1. Map hot spots of art graffiti, distinguish them from other graffiti hot spots, and try to predict when these locations are most likely to be hit.
2. Identify chronic offenders or crews by close study of writers' corners and "walls of fame."
3. Try to identify older, more experienced writers, who often recruit novice writers.

The NYPD's Vandal Squad concentrated on removing the most prominent graffiti artists. For big busts they spent time researching and developing a profile of the writer's identity. Since active writers were extremely secretive about their identities, the Squad often made very public arrests of older writers, therefore discouraging the younger ones.

4. Monitor websites, such as graffiti.org, that promote graffiti writing. These websites provide a wealth of information not only on individual and crew activities, but also their associates and networks. See if they include specific information about your jurisdiction.

38 OUTLAW MOTORCYCLE GANGS

THE HELLS ANGELS ARE THE BEST KNOWN OF ALL OUTLAW MOTORCYCLE GANGS (OMG). These are criminal organizations that are mostly involved in the distribution of illegal drugs, though they also commit other crimes, including extortion, intimidation, kidnapping, money laundering, robbery, motorcycle theft, and homicide.

The gangs are strictly hierarchical and vary in size from a single chapter to hundreds of chapters worldwide. The "Big Four" American-based OMGs are the Hells Angels, the Outlaws, the Bandidos, and the Pagans (see Table 16 on page 106). Local-level OMGs usually comprise fewer than 50 members.

Most national-level OMGs maintain criminal networks of regional and local motorcycle clubs, commonly referred to as "support," "puppet," or "duck" clubs, whose members undertake crime in support of the larger OMGs, and who are a source of new members.

The 1% gangs

In July 1947, a fight between two motorcycle gangs led to arrests and considerable publicity. One of the gangs was the "P.O.B.O.B." (Pissed Off Bastards Of Berdoo), which one year later took the name "Hells Angels." Commenting on the incident, the president of the American Motorcycle Association declared that motorcycle riders are law-abiding citizens with only 1 percent causing trouble. This marked the birth of OMGs, some of whose members now wear a diamond-shaped patch with "1%" on their "cuts."

Approximately 20,000 OMG members reside in the United States. They are white males who ride "American Iron," i.e., Harleys and Harley facsimiles with engines of at least 750cc. The early requirement of having an American-made motorcycle still exists today. Riding any other motorcycle is grounds for expulsion from the group.

OMG members are identified by their "colors" or patches, which are sewn on denim jackets or black leather vests and referred to as "cuts." The top rocker of the three-piece patch identifies the gang. The center shield is the gang's logo, some of which are legally trade-marked or copyrighted. The bottom rocker identifies the area or territory which that chapter or gang claims to control.

Patches and tattoos denote members' status. For example, the Hells Angels' Filthy Few patch indicates that the wearer has committed a murder for the organization. Its Dequiallo patch indicates that the wearer has committed an act of violence toward a person in authority or violently resisted arrest. The Big Four OMGs used to not attack police officers because they believed that the resulting heightened enforcement would cost far more than was gained. Since the mid-1980s, however, attacks on police have increased.

Most OMG chapters have clubhouses that are used for business and social gatherings. These have meeting rooms, bars, gym equipment, and garage areas. They have extensive security, including video-cameras, telephone scramblers, and 24-hour watches.

What facilitates OMG activities?

- Failure by police to identify and remove more violent members of the gang
- Failure to disrupt the gang by identifying and removing its leadership
- Failure to identify and dismantle "support," "puppet," or "duck" clubs
- Lack of criminal intelligence information sharing among jurisdictions
- Absence of bylaws prohibiting fortified clubhouses
- High demand for illegal drugs

Did you know?

- OMGs often confiscate property from expelled members and may brutally remove gang tattoos.
- Bikers who deal with the police or rival gangs, or are drug addicts, face expulsion or death.
- Hells Angels have a saying: "Three can keep a secret if two are dead."
- Bikers hang rival colors or police items upside down to signal disrespect.
- Outlaw bikers are bringing more discrimination and harassment suits against police.
- The Internet is the preferred means of communication for some OMGs.

Examples of what has been done regionally and nationally to deal with OMGs

A variety of national and international initiatives have been launched to deal with OMGs, such as the National Association of Chiefs of Police's (NACP) National Strategy to Combat Outlaw Motorcycle Gangs, and Interpol's Project Rockers that monitors OMGs throughout the world and shares information with member states about OMG memberships, *modus operandi*, and criminal activities. The project posts "red notices" that seek arrest of OMG members with outstanding warrants, and "green notices" that provide information on those who operate internationally.

Project Focus—run by the Criminal Intelligence Service of Canada—provides Canadian authorities with current information on OMGs to help them devise effective biker enforcement policies. The project maintains information on active gangs, location of clubhouses, and photo albums of gang colors in North America. It also collates information on known members including plates, telephone numbers, tattoos, physical descriptions, nicknames, and addresses.

Table 16. "Big Four" American-based outlaw motorcycle gangs

HELLS ANGELS • 2,000-2,500 members in the United States and 26 other countries • Engages in drug trafficking and a variety of other crimes such as extortion, homicide, money laundering, and motorcycle theft • Most concentrated population in California; operates internationally
BANDIDOS • 2,000-2,500 members in the United States and 13 other countries • Mostly involved in drug trafficking • Active in the Pacific, Southeastern, Southwestern, and West Central U.S. regions
OUTLAWS • 1,700 members in the United States and 12 other countries • Similar involvement in drug dealing and crimes as the Hells Angels • The dominant OMG in the Great Lakes region
PAGANS • 900 members in the United States, none outside the United States • Cooperates with traditional organized crime groups • Operates mostly in the Northeastern United States

What can you do?

Assist your agency's on-going investigations of OMGs by constructing a social network analysis of gang members (see Step 19), using data from surveillance and informants and, if available, from wiretaps. This will assist you in describing the hierarchy of command and therefore where your agency should focus its efforts to arrest the leadership.

What can your agency do?

Establish task forces. Many police agencies have established task forces that gather intelligence about local OMGs. For example, task force members might stake out OMG clubhouses and systematically record those entering. The task forces include a network of correctional, parole, and probation officers that give police added leverage for interviewing potential informants and witnesses.

Use undercover operations and informants. Undercover agents have been used to infiltrate OMGs. This can be dangerous and the agent might have to make significant compromises because the initiation process usually involves activities that are illegal or conflict with ethical policies of police departments. An alternative is to make use of informants, but this can also result in serious threats to their safety.

Use technology. Computer-assisted dispatch (CAD) hazards files can alert responding officers to OMG members' homes, work places, and locations visited, so that the officers can write offense or incident reports.

Be sure to share information. Placing gang members into the National Crime Information Center files will help notify investigators when police contact is made for traffic violations or when tracking gang members' activities and movements.

Seek the passage of bylaws prohibiting fortified buildings. Canadian municipalities have done this to prevent fortified buildings from being used as bunkers for OMGs. The bylaws regulate security features, such as metal doors, bullet-proof windows, surveillance towers, and security technology.

National Drug Intelligence Center. 2009. *National Gang Threat Assessment, 2009*. Tallahassee, FL: National Gang Intelligence Center.

39 STREET GANGS

LOW-INCOME NEIGHBORHOODS, MARKED BY UNEMPLOYMENT AND VIOLENCE, ARE THE MAIN BREEDING GROUNDS FOR street gangs. These gangs are no longer confined to large cities, but are now found in suburban and rural areas. Many are engaged in drug dealing, however they could also be involved in other criminal activities, including robbery, auto theft, drive-by-shootings, and homicide. Many gang members join to make money from crime, but they also see the gang as a brotherhood or a support system, which they join to seek protection and respect.

According to the National Drug Intelligence Center, there are an estimated 900,000 street gang members across the country. States with the largest gang populations are California, Illinois, Texas, Florida, and Ohio. About 90 percent of gang members are African American or Hispanic (with a few Asian gangs) and about half are under the age of 18.

Street gangs are classified into three main groups according to size and operational reach:

1. National gangs comprise several thousand members that operate both nationally and internationally, especially in Mexico and Central America. Some of these include: Almighty Latin Kings, the Crips, the Bloods, 18th Street, Asian Boyz, and Vice Lord Nation.
2. Regional gangs are composed of several hundred to several thousand members. These include Florencia 13, Fresno Bulldogs, Latin Disciples, Tango Blast, and United Blood Nation.
3. Local gangs, also referred to as neighborhood gangs, vary greatly in size from a handful of individuals to a hundred or more members.

How are they organized?

Most gangs are loosely knit coalitions of small, autonomous cliques. Leadership of these gangs is usually decentralized and nonhierarchical. It can change rapidly and may vary by the type of gang activity; e.g., drug sales leaders may differ from "gangbanging" leaders.

The more organized gangs may have clearly defined leaders and leadership roles. These roles may include "making sure all laws and policies are being followed," "giving orders," "being the thinkers," and "making the overall decisions for the group."

In 1990, Los Angeles instituted "Operation Cul-de-Sac" in Newton, an inner-city neighborhood plagued by drug and gang activity. Barriers were installed to impede drive-by shootings and drive-up drug purchases. Foot and bicycle patrols were stepped up to suppress these crimes and to improve police-community relations. The barriers prevented cars from entering the street, or required those that entered to leave the same way. This increased the risks for shooters, because their targets would have their own guns ready when the car returned. In the two years after the barriers were installed, only one homicide was recorded, whereas in the year before seven homicides were committed in the area. Homicides were not displaced elsewhere.

Source: Ronald V. Clarke. 2005. *Closing Streets and Alleys to Reduce Crime: Should You Go Down This Road?* Problem-Oriented Guides for Police, Response Guide No.2. Washington, D.C.: U.S. Department of Justice, Office of Community Oriented Policing Services. Accessible at www.cops.usdoj.gov.

Many organized gangs hold regular meetings to collect dues and discuss any problems, as well as to enhance group cohesion, to communicate responsibilities, and disseminate information.

Gang member affiliations can be identified through "colors" (clothing and emblems), tattoos, hand signs (used within the gang), and graffiti (gang symbols on clothing, school books, backpacks, and walls).

Learn about Internet databases, such as GangNet and Cal/Gang, that allow law enforcement agencies to identify individuals involved in gangs—their names, street names, addresses, known associates, gang hand signals, vehicles, and tattoos. Cal/Gang can be accessed by law enforcement officers in California, while GangNet is used in many states and in Canada. The Orange County (California) Gang Incident Trafficking System combines traditional crime mapping and gang crime reporting. Local analysts used the system to discover that adult gang members were far more likely to be involved in violence than juvenile gang members, a crucial fact that was used to redirect the agency's gang intervention programs.

Gang members can be classified as hardcore, associate, or wannabe members. These designations are based on their criminal performance, street-smarts, incarceration experience, or abuse endured for the group. Membership is sometimes defined by age, such as "youngsters," "old gangsters," "young homies," and "old homies."

Examples of action taken against gangs

Two federal statutes are used to prosecute street gangs: the Racketeer Influenced and Corrupt Organizations (RICO) Act, and the continuing criminal enterprise (CCE) statutes of the Comprehensive Drug Abuse Prevention and Control Act of 1970. These "conspiracy" statutes allow prosecutors to present evidence of multiple criminal acts committed by various members of the gang.

Some cities, including Los Angeles, San Antonio, and Chicago, have adopted gang injunctions as a way of addressing local gang problems. These restraining orders are issued against specific gang members by the city's Attorney's Office and approved by a judge. The orders prohibit the gang members from engaging in certain activities that may range from selling drugs or possessing a weapon, to congregating in a group, being out at night, and possessing a cell phone.

The National Gang Center provides descriptions of successful anti-gang programs, and offers links to tools and databases that assist police to address the gang problems within their jurisdictions. The Center collates daily newspaper reports on national gang activity, and maintains a database of professionals working with gangs.

The Boston Gun Project is the most successful program to date in addressing gang violence (See Step 26).

What can you do?

Although your jurisdiction might have no homegrown gangs, gangs are mobile and you might have to deal with those that come from nearby cities. You can gather intelligence about their colors, signs, activities, and rivalries either directly, or from the police agencies who are dealing directly with these gangs. You should seek information to answer questions such as:

- How prevalent is the problem and how many gangs are in operation? Are they national, regional, or local gangs?
- Which of them pose a threat and what criminal activities are they engaged in?
- How many gang members can be identified? What is their demographic profile, i.e., racial/ethnic composition, age group, immigration status?
- Who are the gang leaders (if any) and what information is available about them? What information should be gathered about them?

Identify hotspots where these gangs are more likely to operate and determine whether their operations also reach larger areas. Determine whether any geographic shifts in their operations occur, and decide how this can be dealt with.

Prioritize gangs by the level of violence of their members. Then focus on the most violent groups first.

With sufficient intelligence in hand, advise your department about response strategies that would work best. These may range from completely eliminating the gang problem to dealing with the problem more effectively.

What can your agency do?

Raise awareness about the gang problem through schools and community organizations and develop partnerships with the community to gain help in addressing the problem. These partnerships should include faith-based groups, social service agencies, and other law enforcement agencies. Most programs that have shown success engaged in collaboration with a wide range of actors and have used a combination of prevention, intervention, and suppression strategies.

READ MORE:

Scott Decker. 2008. *Strategies to Address Gang Crime*. Washington, D.C.: U.S. Department of Justice, Office of Community Oriented Policing Services.

40 AUTO-ACCIDENT FRAUD RINGS

CRIMINAL RINGS ARE FREQUENTLY INVOLVED IN AUTO-ACCIDENT INSURANCE SCAMS, of which there are two main kinds: (1) staged accidents for which insurance claims are made; and (2) false injury and physical damage claims, so-called "build ups," resulting from actual accidents. These cases sometimes include "jump-ins," people who were not present at the accident but who file claims.

The groups involved may use the funds from insurance frauds for other criminal activities, such as drug trafficking. Indeed, the rings include many former drug traffickers.

The rings often hit insurers with many small claims to stay under the company's anti-fraud radar. When insurers begin to investigate such claims, they may find they are dealing with large rings with a wide reach.

According to the FBI, auto-accident frauds cost the insurance industry about $20 billion a year. Densely populated states, such as New York, New Jersey, California, Florida, and Massachusetts are among the hardest-hit. New York City is especially vulnerable.

Who is involved and how are they organized?

Auto-accident fraud rings recruit "accident victims" in two main ways:

- They use **"runners"** to recruit phony victims, often new immigrants, who are paid for participating in fake auto accidents.
- They use **"steerers"** to recruit accident victims from news reports, by visiting hospital emergency rooms and by approaching people who visit the police to collect copies of accident reports. They show these people how to profit from the accident and take them, or refer them, to clinics associated with the rings or directly operated by them.

  These clinics pad the bills with expensive and unnecessary treatments and then collect payment from the insurance company.

In response to legislation that classified insurance frauds as felonies, the rings have shifted tactics from actual to paper accidents. This is done by using information from legitimate or falsified police reports to steer patients to medical clinics.

Two common scams

Scheme 1. Load a car with people, pull in front of another car and slam on the brakes. If the expected collision ensues, the innocent party is almost always liable. Young women and the elderly are frequently targeted, the former because they are more prone to admitting fault and the latter because they are prone to becoming flustered. These scams, called "swoop and squat," sometimes target buses, where the passengers, who work with the ring, immediately report injuries and file insurance claims. Bus drivers sometimes work directly with the ring.

Scheme 2. Load two cars with people, crash the cars, call the police and say that everybody was hurt. The insurance companies are then billed for unnecessary medical procedures. Again, these schemes may also include buses.

Instead of paying people to borrow their insurance and their cars, the rings may use false identities to purchase cars and insurance, and, therefore, to file false insurance claims.

Factors contributing to auto-accident insurance fraud

- Ordinary citizens who are willing to participate in the schemes, because they believe that: (1) they are entitled to compensation for money they have paid in policy premiums; (2) the frauds only hurt insurance companies who deserve to be "hit"

- Lack of insurance staff trained to detect fraudulent claims
- Lack of public awareness programs to educate potential victims
- Lack of state insurance fraud bureaus that can undertake cross-jurisdictional investigations

What has been done nationally to address the problem?

In 1976, Florida passed the False and Fraudulent Insurance Claims Act (FFICA), which made insurance fraud a specific offense. Florida also created the Division of Insurance Fraud to investigate frauds falling under the definitions of the FFICA. Since then, many other states have established similar insurance fraud bureaus.

The National Insurance Crime Bureau (NICB) was formed in 1992 by over 1,000 member insurance companies to help deal with insurance fraud. The NICB serves as a conduit between the insurance industry and federal, state, and local law enforcement agencies. It holds multiple databases, currently with more than 350 million records of suspicious claims, which insurance companies can access to check claims.

A successful prosecution

In November 2000, the Federal District Court in Brooklyn broke up a 53-member auto insurance fraud ring that cheated insurance companies out of more than $1 million by staging 27 crashes in New York City. Two employees of Medical Arts Rehabilitation clinic led the ring. They paid people $500 to stage an accident. These people recruited new drivers and passengers to crash their own cars, who were treated at the clinic for injuries that were never sustained. The clinic then billed insurance companies for up to $20,000 for medical services, while the passengers filed bodily injury claims for between $3,000 and $22,000. Many of the recruits were "unsophisticated and often recent arrivals to the United States."

Source: Alan Feuer. 2000. Car Crashes Were Staged For Fraud, U.S. Charges. *New York Times,* November 17.

Most insurance companies subscribe to the American Insurance Services Group Index, which provides data pertaining to bodily injury and workers' compensation. Many have established hotlines with interactive conversation that allows for the gathering of detailed information about possible insurance fraud claims. Many have also established Special Investigative Units (SIU) specifically to investigate possible fraudulent claims.

Randolph (Massachusetts) P.D. partnered with other state and county law enforcement entities to form the Community Insurance Fraud Initiative (CIFI), a task force to address the city's auto insurance fraud problem. The CIFI offered a $5,000 reward for information leading to the arrest and conviction of perpetrators of the fraud. Two hundred and sixty-three individuals were arrested, which, together with arrests made by other task forces operating in six nearby cities, resulted in a reduction of $100 million in fake auto accident claims in those cities in 2004.

What can you do?

Gather information on the time and location of auto-accidents, as well as the number of people involved in each accident to determine if possible rings are involved. Staged auto-accidents happen during busy times on busy streets, and generally involve many passengers.

Determine if there is a high concentration of auto accidents in neighborhoods or areas with high concentrations of immigrant populations. Gather information about the people involved in the accidents, including their age, gender, and ethnicity, which may help determine whether staged accidents are taking place.

Learn how to use the different databases provided by NICB designed to fight insurance fraud. The wealth of knowledge provided by this organization can prove valuable in your department's investigative efforts.

What can your agency do?

Coordinate fraud probes with the insurance companies as well as other law enforcement agencies—such as the Attorney General's office, district attorneys, or U.S. attorneys—as the problem may require a multi-jurisdictional approach.

Deploy undercover officers posing as accident victims to probe unscrupulous medical clinics that pad claims. Determine if these clinics work with an auto-insurance fraud ring and try to infiltrate their operations.

Execute wiretaps to gather information from medical clinics, lawyers, and employees of the insurance company suspected of involvement in the ring.

Work closely with community organizations and immigrant groups to educate them about the dangers and risks involved in taking part in staged auto accidents.

Tony Baldock. 1997. *Insurance Fraud*. Trends and Issues in Crime and Criminal Justice, No. 66. Australian Institute of Criminology.

41 ORGANIZED SHOPLIFTERS

ORGANIZED SHOPLIFTERS STEAL LARGE AMOUNTS OF MERCHANDISE FOR RESALE. They may operate across state lines, and may target the same chain in different places. Their arrival in your town might be signaled by a spike in reports of goods being shoplifted in large quantities.

The groups are frequently composed of immigrants (legal or not) from the Middle East, South America, or Asia. This may be because they can sell the goods they steal to fellow immigrants who run small businesses. The groups sometimes also take part in drug trafficking, car theft, and burglary.

The FBI reports that organized retail theft costs businesses $12–$35 billion annually in stolen goods, lost sales, and replacement costs. It is believed that the profits from organized shoplifting are sometimes used to fund foreign terrorists; according to the CRISP report (in the Read more section), "money laundering has been proven in many, if not all, organized retail crime rings operated by Middle Easterners."

How are they organized?

Each group consists of several members with distinct roles: "boosters" steal the goods; "handlers" sell the goods to fences; and others take care of transport and logistics.

Boosters act alone or in groups. They steal large quantities at one time, usually of the same items. They carry tools to remove security tags, they use foil-lined bags to defeat electronic tags, and they may use cell phones to communicate with other group members while shoplifting. They may change bar codes so merchandise registers at a much lower price on checkout ("ticket switching"). They may use stolen credit cards and use the receipts to return stolen goods to the store for cash. In some cases, they may simply wheel carts full of merchandise out the doors to a waiting getaway van.

The stolen property may be held in rented storage units before being taken to the group's home base. The property is often sold to *street-level fences*, who might own a bodega, pawnshop, or gas station. Some fences operate from home, selling items door-to-door, in flea markets and local taverns, or even on the Internet. They might sell-on the goods to *mid-level fences*, who clean and repackage them to look like new and then sell them to *wholesale diverters*, who might mix them with legitimate goods for sale to retailers.

What facilitates the work of organized shoplifters?

- Their unexpected arrival in towns and cities and equally quick departure
- Their links with immigrant communities, which facilitate disposal of goods
- Complacent retailers who have not been victimized by organized shoplifters
- Low priority accorded by police, prosecutors, and judges to shoplifting and fencing operations
- Poor security in many stores that puts them at risk (see below)

Which stores are at risk?

1. Those that sell goods that are CRAVED (concealable, removable, available, valuable, enjoyable, and disposable). Designer clothing, over-the-counter medicine, electronics, DVDs, health and beauty supplies, razor blades and infant formulas are considered to be among the "hot products" targeted by organized shoplifters in supermarkets.
2. Large stores that make it easier for organized groups to hide among ordinary shoppers
3. Stores located close to highways that provide easy escape routes
4. Stores with many part-time associates who have less commitment, lack theft awareness, and have limited training

5. Stores with the security weaknesses that aid ordinary shoplifters (see *Shoplifting, 2nd Edition,* Problem-Oriented Policing Guide No 11). Such weaknesses include:
    a. Lax return policies that allow thieves to return stolen items to the store for credit or cash
    b. Unmonitored exits, blind corners/spots, high displays that conceal thieves from view, and open displays of high-risk items
    c. No security staff, poor stocktaking, and lacking security equipment such as electronic article surveillance and video-cameras
6. Stores that do not report shoplifting to the police

What is being done regionally and nationally?

Walmart, Target®, Lowe's®, Limited Brands, and other large retailers seek to identify organized shoplifting rings by investing in software that tracks regional patterns of theft.

Many states have passed laws that address organized retail crime and, in 2009, Congress passed the Combating Organized Retail Crime Act and the E-fencing Enforcement Act.

The Law Enforcement Retail Partnership database (LERPnet) was created for merchants to share information on organized shoplifting with local, state, and federal law enforcement, as well as with other retailers.

What can you do?

Regularly scan for stores with high shoplifting rates (see Table 17 on page 116) and try to determine the reasons. Notify your supervisors about the need to alert the stores to their problematic status and the need to take preventive actions. Keep in mind that reported shoplifting may be significantly lower than actual shoplifting due to differences in store security policies and staffing.

Alert other analysts and police officers to signs of organized shoplifting.

What can your agency do?

Work with local merchants to encourage reporting of shoplifting and early sharing of information about the arrival of an organized crime shoplifting group. Alert nearby jurisdictions to the possible arrival of these groups in their locations.

Educate retailers about theft prevention and the importance of reporting shoplifting incidents. Measures focused on organized shoplifting include: displays that prevent the removal of multiple packages at one time; cabinets that beep if open too long; and stamping the store's name on over-the-counter medicines or infant formula cans to reduce their re-sale value.

Reduce the opportunities to dispose of stolen goods by regularly monitoring pawnshops, flea markets, and used-goods stores. Visit local bodegas, taverns, and other small businesses, especially those owned by recent immigrants, to ask about suspicious attempts to sell them goods.

Table 17. Reported shoplifting by store in Danvers, Massachusetts

Scan regularly for stores with high rates of shoplifting. Crime analyst Christopher Bruce did this for the Danvers (Massachusetts) Police and produced this table. The store with the most shoplifting incidents was one of the largest in the town. But when size was taken into account by calculating the number of thefts per 1,000 square feet (see the final column of the table), the riskiest store turned out to be the one that had been ranked 3rd on the list before correcting for size; it was a tiny boutique store with staggeringly high shoplifting.

Visit the riskiest stores and try to understand why their rates of shoplifting are so high and what they might do to reduce the risks.

42 ORGANIZED CAR THIEVES

TEMPORARY THEFT OF CARS, OFTEN COMMITTED BY JUVENILE JOYRIDERS OR, TO A LESSER EXTENT, FOR USE OF THE car in committing another crime, accounts for the bulk of car thefts. Permanent thefts, where the car is never recovered, are often committed by organized criminals, who are employing increasingly sophisticated tactics to outsmart today's anti-theft devices. These thefts account for the bulk of the costs of car theft. In 2011, 47.7 percent of the value of the vehicles stolen was never recovered according to UCR reports, causing losses of about $1.8 billion nationwide.

Several forms of permanent theft exist, including:

- "Rebirthing," which is giving the car a new identity for resale
- "Chopping" the car and selling its parts
- Exporting the car, which is accomplished by shipping it overseas from one of the nation's many sea ports or driving it over the border to Mexico

You should try to determine if a car theft ring is operating in your area, and whether the cars are stolen for export. Theft for export is particularly likely if you are close to the Mexico border or near a major port. This step describes two techniques that will assist you in this task. It does not describe the facilitating conditions for organized car theft, or the *modus operandi* involved, since these are used for illustrative purposes in Step 10, "Modify the conditions that facilitate organized crimes," and Step 11, "Study the *modus operandi* step-by-step."

Compare your auto theft rates with those of other jurisdictions

Officers in Chula Vista (California) P.D. suspected that being close to the Mexican border exacerbated the city's auto theft problem. The department's crime analysts tested this idea by calculating the theft rates for Chula Vista and neighboring cities. They found that Chula Vista's auto theft rates, and those of other cities closest to the border, were two to six times higher than ones further north in San Diego County (see Figure 17). Many vehicles were stolen from parking lots and driven across the border before owners had even discovered the thefts. The analysts also found that pick-up trucks—highly prized in Mexico—were at greatest risk, and that the recovery rates of these trucks stolen in Chula Vista were lower than in cities further from the border.

Organized car theft on the U.S./Mexico border

Resendiz has described a division of labor among those involved in the export of stolen vehicles from the United States to Mexico:

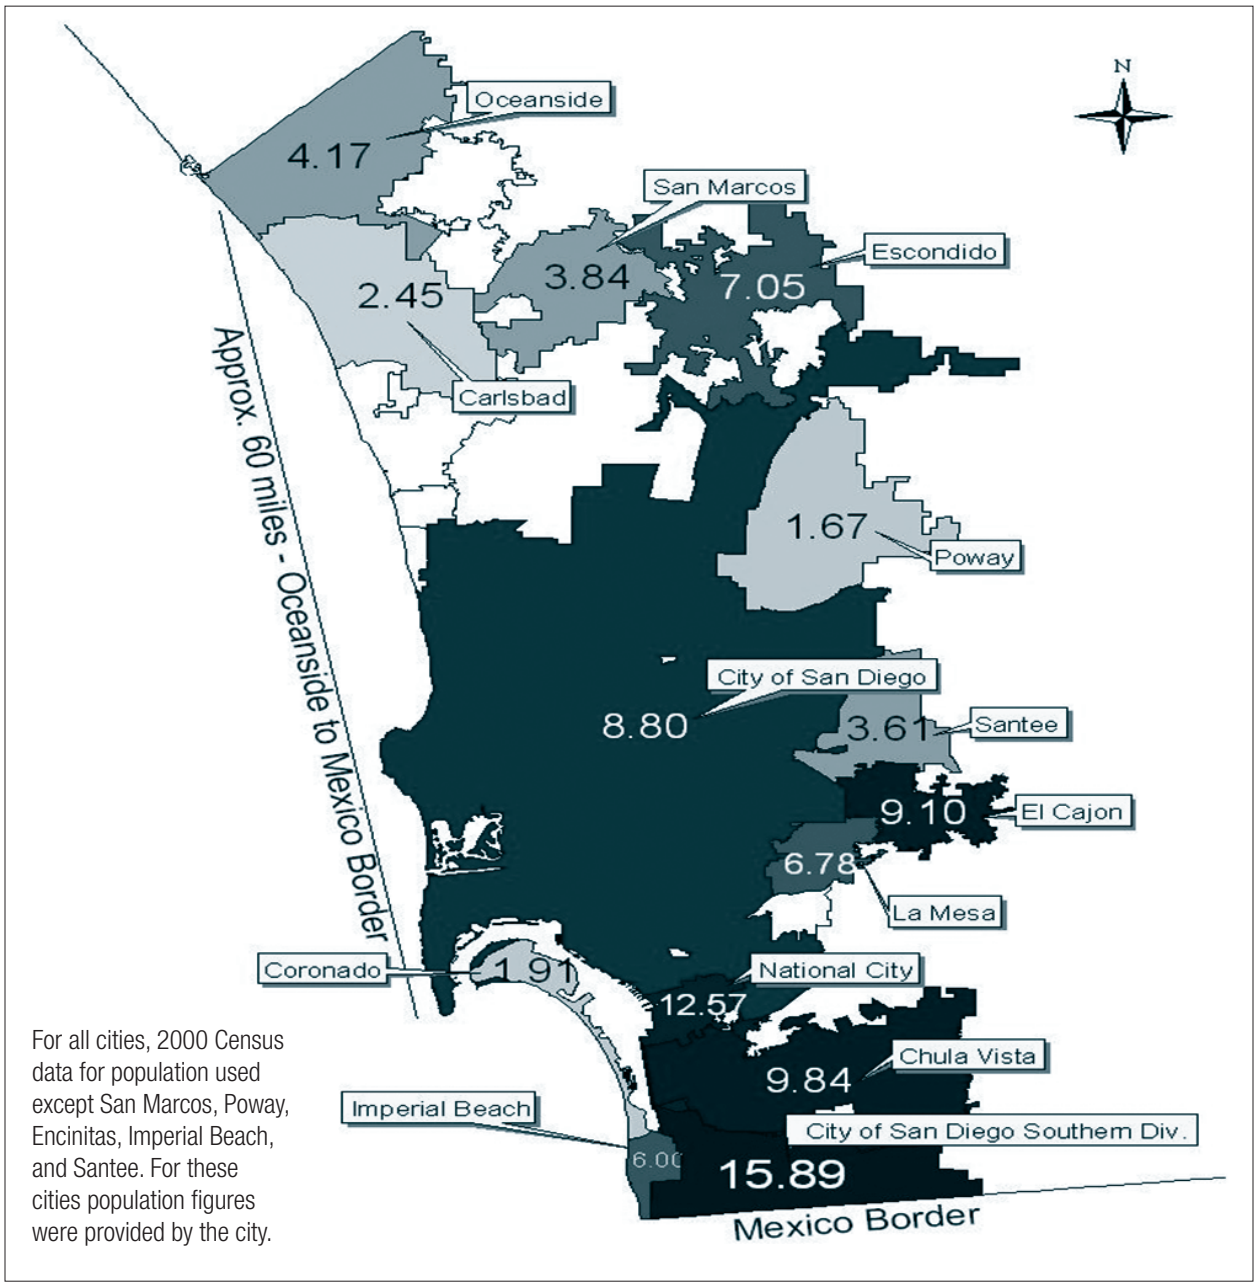
Chauffeurs provided vehicles to cruise around mall parking lots and residential areas to "shop" for possible target vehicles.

Specialists used different tools to steal different model vehicles. They used flat head screwdrivers and vise grips to open Chevrolets, master keys for Chryslers, dent-pullers, screwdrivers, and vise grips for Fords. They usually took between fifteen seconds to one and a half minutes to break into any car.

Mounters were responsible for driving the vehicle to the buyers in Mexico. Once the vehicle was crossed, it was dropped off at a designated hideout, and from there, to customers and buyers.

Source: Rosalva Resendiz. 1998. International Auto Theft: An Exploratory Research of Organization and Organized Crime on the U.S./Mexico Border. *Criminal Organizations* 12:25–30.

Figure 17. Vehicle theft rates per 1,000 residents in San Diego County, 2001



Source: Plouffe and Sampson 2004.

Calculate location quotients to identify a possible theft for export problem

The fact that many vehicles are stolen in your area may not mean that organized car thieves are operating; it could simply reflect a generally high rate of crime in your area. To test this you can calculate a Crime Location Quotient (CLQ). A CLQ compares the total number of a particular crime across a set of geographical units (for example, neighborhoods, cities, or counties), taking into account the distribution of other crimes in those units (see Figure 18 for an example of the calculations). It is the ratio of target crimes to all crimes in a jurisdiction (e.g., county) divided by the ratio of the target crimes to all crimes in a larger area (e.g., state).

Figure 18. CLQ calculation to estimate the prevalence of theft for export in U.S. counties

Researchers have recently used the CLQ calculation to estimate the prevalence of theft for export in U.S. counties.

They used the following formula:

CLQ= (a/b)/(X/Y)

a= total number of motor vehicle thefts within the county

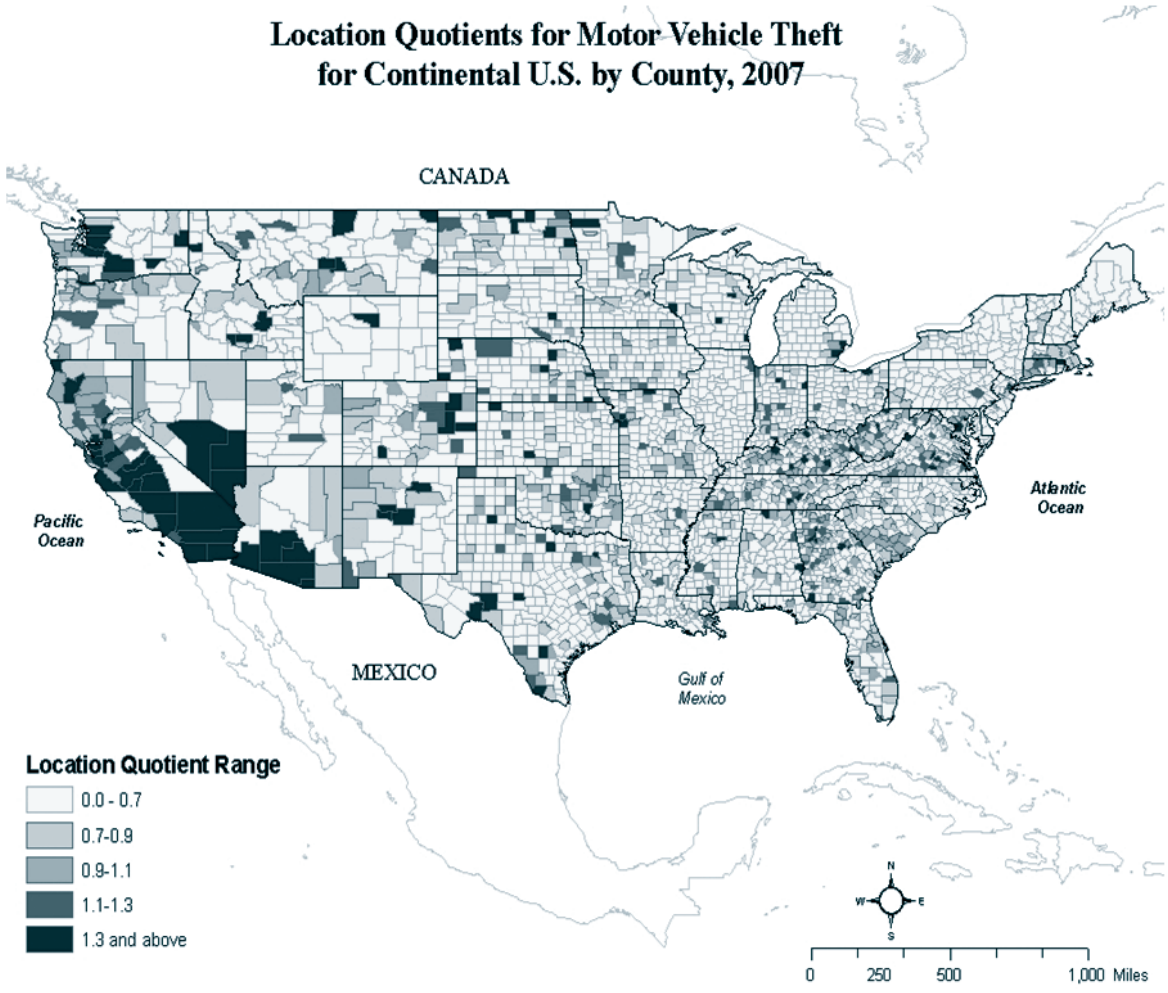
b= total number of all index crimes within the county

X= total number of motor vehicle thefts within the state where the county is located

Y= total number of all index crimes within that state

A CLQ value of 1.00 indicates an area has a typical representation of that crime compared to all other crimes. CLQ s over 1.00 indicate overrepresentation of a particular crime, while CLQ values under 1.00 signify underrepresentation.

The map shows that theft for export is prevalent near heavily-trafficked borders and ports in the United States.



What has been done to prevent theft for export?

Anything that makes it harder to steal a car will slow down the work of organized car theft rings, especially of the less sophisticated operators. Over the years, a wide variety of measures have been introduced to increase the risks or difficulty of car theft, including improvements to vehicle security, parking facilities, and vehicle documentation procedures. (In recent years, very promising reductions in theft have been reported for vehicles fitted with electronic immobilizers at manufacture—which is now a requirement for all new vehicles in the European Union, Canada, and Australia, but not yet in the United States.) In addition, some other measures specifically intended to reduce theft for export have been introduced, such as:

- The United States has developed a model bilateral agreement for the repatriation of stolen vehicles and has signed agreements with numerous countries in Latin America. U.S. agents have provided training to customs officials in these countries in ways to identify stolen cars.
- The National Insurance Crime Bureau has assisted these efforts by stationing officials in Mexico and other South American countries to assist the process of repatriation.
- U.S. Customs is field testing portable, hand-held computer scanners that will give inspectors in the field instant access to VIN information, as well as identify vehicles previously presented for export.
- X-ray machines that can detect vehicles concealed in containers are increasingly being deployed at major U.S. sea ports.
- Many local programs encourage citizens to participate in vehicle theft prevention. For example, a program implemented by the McAllen (Texas) P.D., "Citizens Against Auto Theft," involved placing colored decals on windows of automobiles. This alerted law enforcement officials that the car is not to be driven during certain hours of the day or driven into Mexico.

What can your agency do?

Should your analyses suggest that a theft for export ring is operating in your jurisdiction, your agency could implement a program such as that developed by McAllen P.D. Publicizing the problem can be another option. By analyzing your vehicle theft records you can determine which makes and models are at most risk, and the public information campaigns can be geared toward encouraging owners of these vehicles to better secure their cars.

43 CLANDESTINE METHAMPHETAMINE LABS

METHAMPHETAMINE IS SUPPLIED BY TWO MAIN TYPES OF NETWORKS: (1) large, highly organized groups involved in trafficking illicit drugs, and (2) smaller, less organized groups of individuals typically involved in methamphetamine use.

The laboratories that produce methamphetamine have changed over time. There are now three main types of clandestine operations in the United States, which vary in organization, size, and production capacity: (1) super labs, (2) mom-and-pop labs, and (3) shake-and-bake or one pot labs. Shake-and-bake labs are the newest and most common type of production method. The shake-and-bake method can produce methamphetamine in about 30 minutes in a plastic bottle.

Clandestine laboratories today are primarily ephedrine and pseudoephedrine based. Most local laboratories in the United States are run by small networks of methamphetamine users and low-level dealers. Group members may coordinate efforts to acquire necessary supplies and chemicals. Restricted precursor chemicals may be obtained by "smurfing," whereby numerous individuals visit multiple retail outlets to make pseudoephedrine purchases. Group members also recruit others to purchase pseudoephedrine. Smurfing activities are increasing and evolving to include the illicit acquisition of bulk quantities of pseudoephedrine.

Clandestine laboratories are hazardous, toxic, and volatile. They are located in a variety of settings including homes, motel rooms, or vehicles. Smaller laboratories are portable and more difficult to detect. While laboratories were traditionally located in specific regions and in rural communities, they are now being found in cities across the United States. According to the DEA, 118,940 clandestine laboratories have been seized in the United States since 2004. Given that law enforcement detects a small percentage of labs, the true number is unknown.

Who is involved and how are they organized?

The groups involved in producing methamphetamine in clandestine laboratories continue to change as the problem evolves. Groups adapt to control efforts and may alter the way they communicate, acquire chemicals and supplies, and produce methamphetamine.

A successful prosecution

A federal prosecution in U.S. District court resulted in the conviction of 13 persons for conspiracy to manufacture methamphetamine. The defendants were charged with collecting chemicals needed to produce methamphetamine from multiple states for production purposes. The group was involved with producing methamphetamine in multiple locations including the home of a 60-year-old defendant. Sentences ranged from 3 years to 20 years.

Source: Todd South. 2012. 13-Person Meth Case Ends with Sentencing. *Chattanooga Times Free Press*, June 23.

Groups may be small (2–4 people) and loosely organized, or larger with more organization. They may be headed by independent operators or in conjunction with criminal gangs. Members may be recruited for specific roles related to manufacturing, including:

- Gathering supplies
- Purchasing precursor chemicals
- Recruiting others to purchase precursors
- Assisting with production
- Distributing methamphetamine

Cash or drugs may be exchanged for assistance. While local production is dominated by small and transient groups, larger, more organized groups have recently become involved in production in California.

Meth supply: at every step, offenders adapt, markets shift, and supply continues

The U.S. methamphetamine supply serves as an example of the challenges of responding to complex and evolving crime problems. Despite decades of attempts to control the supply of methamphetamine, clandestine production and trafficking continues and methamphetamine is widely available. Local manufacturers have continually adapted to control efforts by discovering alternative methods of production. Reductions in local supply are regularly offset by increases in production and trafficking from Mexico. There is need to develop a better understanding of the processes that underlie offender adaptation and offending evolution at local, national, and international levels.

Factors contributing to clandestine manufacturing

- Continuing demand for methamphetamine
- Profitability
- Increased use of smurfing to acquire bulk quantities of pseudoephedrine
- Retail outlets that sell pseudoephedrine products without questioning suspicious purchases
- Continuous adaptations in manufacturing production processes

What has been done nationally to address the problem?

In 2005, the U.S. Government passed the U.S.A. Patriot Improvement and Reauthorization Act. This legislation restricted retail access to pseudoephedrine, placed limitations on the purchase quantities, enhanced penalties for offenders, and increased regulations for distributors. Individual states have enacted various laws aimed at restricting access to precursors, criminalizing manufacturing-related activities, and increasing punishments. In 2006, Oregon became the first state in the United States to require a prescription for pseudoephedrine.

What can you do?

Conduct an in-depth analysis of the methamphetamine problem. Assess each dimension of the broader problem (i.e., use, trafficking, and manufacturing).

Data on drug treatment admissions are available from Substance Abuse and Mental Health Services Administration on the Treatment Episode Data Set (TEDS) website. Data on arrests, convictions, and sentences of criminal offenders can be obtained from criminal justice agencies.

Determine whether methamphetamine is being manufactured locally, imported, or both. Identify how much of the methamphetamine on the streets is being produced locally versus being trafficked in from out of state or out of the country.

If local production is occurring, gather information on the following:

- Type(s) of production processes being utilized
- Type(s) of laboratories producing methamphetamine
- The main ingredients being used
- Where offenders are obtaining ingredients and supplies
- How are offenders are obtaining precursor chemicals both legally and illicitly

Create a record of clandestine lab seizures and analyze this data to identify trends in production at the local level.

Review logs of local pseudoephedrine sales for suspicious patterns of purchases and to determine if certain retail outlets are selling disproportionately high rates of pseudoephedrine.

Look for information everywhere. You may need to talk to law enforcement officers, review police reports, and discuss the issue with community members who may have special knowledge about the problem. This could include pharmacists, persons who work in farming communities where anhydrous ammonia is

available, and personnel employed at stores where other chemicals and supplies needed to manufacture methamphetamine are sold. Understanding which communities have high rates of methamphetamine consumption and how many individuals with previous involvement in manufacturing or related activities reside in the area will be helpful.

What can your agency do?

Gather intelligence on clandestine manufacturing from confidential informants and by sharing information with other law enforcement agencies in the area. Intelligence sharing is essential for obtaining information on suspicious patterns of activity that may cross jurisdictional boundaries.

Coordinate investigations with other law enforcement agencies.

Conduct undercover surveillance operations in retail outlets that sell pseudoephedrine in communities known to have high rates of methamphetamine use or that sell disproportionately high rates of pseudoephedrine products.

44 CRUISING

ON WEEKEND EVENINGS, CITY CENTER PUBS IN BRITAIN ARE CROWDED BY YOUNG MEN AND WOMEN who are there to see and to be seen. In Mediterranean countries, especially on warm evenings, the same demographic groups fill the cafes and stroll on the piazza. In North America, late on fine evenings in spring and summer, young people, sometimes in the hundreds or even thousands, "cruise" the local strip in their automobiles, driving slowly, bumper-to-bumper.

Cruising is a means for young men to show off their cars, to compare them with other people's cars, to find racing competitors, to socialize, and to impress young women. In many communities across the country cruising is considered a pastime and a rite of passage, encouraged and glorified by movies like *American Graffiti* and *The Hollywood Knights*. According to a 2002 survey conducted by Teenage Research Unlimited, 60 percent of teenagers spent at least four hours a week cruising in a car. Another survey of young cruisers between the ages of 19 to 21 revealed that 80 percent of the time their parents knew and approved of their cruising in the downtown area. It seems that parents preferred the downtown area because of the supervision of patrol officers.

On the other hand, cruising can bring many problems in its wake. It snarls traffic, it can prevent access by emergency vehicles, and it can bring commerce to a halt. It may also bring problems of litter, urinating in public, underage drinking, vandalism, and worse. It is these consequences of cruising that the police need to address, not the otherwise harmless behavior of ordinary young men and women looking for social interaction.

Cruising is generally confined to downtown areas, though in coastal communities it is common along beaches. Cruisers drive a wide range of cars that include classic cars (whose drivers tend to be older and cruise to show off their expensively restored vehicles); pickup trucks (on huge wheels and jacked up suspensions); mini-trucks, muscle cars, low riders (whose chassis ride just inches off the ground); imported customized European cars; and Harley-Davidson motorcycles.

Factors contributing to cruising

- Automobile ownership and accessibility to teenagers
- The need to be socially accepted
- The desire to show off vehicles
- Many cruisers are too young to go to bars or other places where they can socialize with friends and the opposite sex
- An unsupervised environment where youth can express themselves

What has been done nationally to address the problem?

The Salt Lake City Council in Utah passed an anti-cruising ordinance prohibiting cars from driving repeatedly (defined as driving three or more times in the same direction) past a "mobile traffic-control point" between 11:00 PM and 4:00 AM in an area identified by police as being congested.

Police in Lakewood, Colorado, employed a strategy of "modified diversion" by closing off known cruising locations during 8:00 PM and 2:00 AM, the time period when cruising was most likely to occur, while minimizing its impact on legitimate traffic and businesses in these areas. The closing was announced through a news media campaign, which began a week in advance of the operation. This effort resulted in complete elimination of the cruising problem in Lakewood.

When the enforcement strategies and the use of barriers failed to solve the cruising problem in Arlington, Texas, the police formed a "cruising committee" by forging partnerships with representatives of the city council, local business owners, and the parks, recreation, and transport

Santa Ana Cruising Abatement Project

The Santa Ana Police Department in California was faced with a serious cruising problem. On Sunday evenings, approximately 1,000 cruisers drove along a major thoroughfare to gather and socialize. The cruising night resembled a large street party, where loud music and alcohol consumption were common, creating problems for nearby residents. Merchants complained that traffic gridlock kept regular customers from their businesses, and many businesses closed early to avoid subjecting their customers to intimidation from the cruisers. The police department responded to the problem by focusing on two weaknesses of the cruisers: (a) they lacked knowledge of anti-cruising laws, and (b) many of the cruisers drove vehicles belonging to their parents or others. The police set up a control point, where information about each vehicle was quickly made available through specially-designed computer software. At the same time, officers distributed an anti-cruising warning to each vehicle moving through the check point. The contact with the drivers was intended to reduce anonymity. Follow-up letters were then mailed to the registered owners of the vehicles advising them that the car had been identified as cruising, an illegal activity in Santa Ana. The letter was intended to warn cruisers who drove their own vehicles, and to inform parents whose cars were being used by their children. The letter warned that anyone who returned to the area to cruise would be subject to arrest. The check points, as well as roadblocks leading to these points were eliminated after several weeks. The project proved to be successful in reducing cruising and related problems in the area.

departments, which leased a downtown parking lot on Friday and Saturday nights and opened it to the cruisers. It was staffed by police, equipped with portable restrooms and cleaned up the next morning. The approach proved highly effective, as it not only solved the cruising problem, but also helped reduce other related problems. Up to 1,000 cars continued to cruise there during an evening, but local people had no longer to endure litter, vandalism, noise, and other public order problems.

What can you do?

If cruising is a problem in your jurisdiction, you can gather information about the characteristics of the cruisers and determine if they are engaged in problematic behaviors that stem from cruising.

Map the locations as well as the days of the week and time of the day when cruising is most likely to occur. Gather as much information as possible about these temporal and geographic patterns. Think about possible interventions you could advise based on successful actions in other jurisdictions. Help your department find an alternative location for cruising that would lead to fewer problems but which would still be used by the young people.

What can your agency do?

Find out more about cruising by surveying local residents and businesses. Engage them in efforts to address the problem.

Once the cruising areas and times are identified, your department may increase enforcement in these areas during these designated times. Leaving aside arrests or citations for cruising, the presence of the police may reduce other related problems in the area.

Find an alternative cruising area that appeals to the cruisers and does not conflict with the area businesses or the residents. This area can be controlled by the officers to ensure security.

45 ILLEGAL STREET RACING

SOME STREET RACERS ARE WELL-OFF STUDENTS, MOTOR SPORT ENTHUSIASTS, AND EVEN MIDDLE-AGED BUSINESSMEN, but the three main groups are:

1. Young working-class males aged 16–25, some of whom attend trade schools or technical colleges, but many may have struggled in school and engaged in other delinquency. Most members of this group quite soon grow out of street racing.
2. Older white males (aged 25–40) who race older American-made "muscle" cars, such as Corvettes, Camaros, and Mustangs.
3. A wide age range of Asian and Hispanic males who generally drive later-model Japanese cars, such as Hondas, Acuras, Mitsubishis, and Nissans. This group currently dominates the street racing scene.

Races test a driver's skill and the capabilities of the vehicles involved. They often take place at night in largely deserted streets or industrial areas. Street racing is not illegal in some jurisdictions, but it tends to be associated with illegal activities, including auto theft, impaired driving, illegal vehicle modification, illicit gambling, gang related activity, trespassing, vandalism, and littering. Fatal crashes linked to street racing have been found to involve both alcohol and excessive speed and often occur on urban surface streets.

How are they organized?

Street races are often publicized by word of mouth and may be attended by dozens of racers and hundreds of spectators. During the race, lookouts keep watch for police using cell phones, police scanners, and walkie-talkies. Some groups may use police tape and false signs to block traffic for the duration of the race, or use rolling road-blocks to stage a race on a large highway.

In some cases, illegal racers may operate websites to post announcements about race locations and about expected police activity. Some websites provide information about the previous night's races, including ratings of police presence and crowd size. They may carry a link to the local police agency so the curious can see if a warrant has been issued for their arrest.

Forms of street racing

- **Drag racing** involves a contest between two vehicles that compete to cross a set finish line. In some jurisdictions drag racing is classified as a Class B misdemeanor. According to the National Highway Traffic Safety Administration, about 135 people die each year in street drag racing accidents.
- **Hat Racing**, also called "cannonball run" or "kamikaze," involves point-to-point races where drivers put money into a hat for the winner. These races are often long distance, sometimes from city to city.
- **Touge** or **Centipede** races, popularized in Japan, occur on mountain passes or around normal traffic, one car at a time, or chase-style with a convoy of vehicles.
- **Burnouts** involve spinning rear tires at high revolutions to produce smoke trails.
- **Donuts** involve accelerating a vehicle with full steering-wheel lock.
- **Rolling Road Blockages** or **Blockades** comprise vehicles traveling slowly in convoy on major highways to prevent other vehicles from passing, so that vehicles ahead can engage in racing.
- **Drifting** involves accelerating around a corner to cause the rear of the vehicle to slide out and the tires to slip on the roadway.

Factors contributing to illegal street racing

- Availability of vehicles to young drivers
- Lack of legitimate venues for racing and the existence of suitable abandoned or unsupervised locations
- The need for thrills and excitement, as well as the expression of masculinity
- Street racers' need for social status
- Existence of street racing movies and video clips on the Internet that can be imitated
- Lack of ordinances prohibiting street racing
- The support of spectators

Examples of what has been done to address the problem

Kent (Washington) Police Department partnered with other law enforcement agencies, private property owners, local businesses, and the insurance industry to develop an enforcement plan known as CRASH (Curb Racing and Achieve Safer Highways). Police conducted surveillance of racing locations to identify races in progress and, once identified, uniformed officers closed off exits from the locations to prevent participants from dispersing. Drivers operating vehicles in violation of the traffic code were cited or arrested. Vehicles operated by drivers whose licenses had been suspended or revoked were impounded.

Some jurisdictions have installed speed bumps, concrete barricades, and freeway billboards to control or inform racers. To discourage spectators, parking can be prohibited on public properties and roadways during prime racing hours in the race area.

Australia and New Zealand have addressed street racing through legislation directed at such activities as dangerous or careless driving, causing unnecessary noise and smoke as a result of "burnouts," and causing deliberate loss of traction doing "donuts." Drivers who take part in these behaviors can have their operator's license suspended and face the immediate impounding of their vehicles for periods of 48 hours to three months. Subsequent offenses may result in forfeiture of vehicles.

San Diego has acted to curb its street racing problem

- By passing a "spectator ordinance" making it an offense to attend an illegal street-racing event, and a "forfeiture ordinance" permitting the police to seize vehicles used in races.
- By establishing "DragNet," a special unit to deal with the races. Officers infiltrate the illegal street-racing group to videotape races and use driver and license plate information to arrest the offenders.
- By designating the Qualcomm Stadium as a location for races, held on Friday nights.

Annual street races are permitted in cities in Canada (Toronto and Montreal) and Australia (Sydney, Adelaide, and Melbourne). This allows racers to experience the fun, camaraderie, and excitement they seek within a safer racing environment. Police can either work with existing national programs (Beat the Heat, Racers Against Street Racing, the National Hot Rod Association) that encourage safe, on-track racing, or implement their own local program.

What can you do?

Determine whether you have an illegal street racing problem in your jurisdiction. If so, study the characteristics of the racers, the kinds of activities they are involved in, and who their supporters are.

Inform yourself about street racing through websites, such as Streetracing.com, RaceLegal.com and NHRA.com. These websites provide racing and club news, articles, calendars, chat rooms, auctions, and message boards for many cities and states. The NHRA website focuses on encouraging legal racing, and attempts to educate users about related laws and statistics, such as number of illegal racers who were recently killed, injured, cited, arrested, or who had vehicles seized or licenses revoked.

Through the chat rooms provided by these websites, you might be able to warn your department about upcoming races in your jurisdiction. Using network analysis you might be able to build up a picture of the major players involved in the groups. You can also infiltrate and monitor social networking sites to remain informed about upcoming street racing events.

What can your agency do?

Inform parents about the dangers of street racing so they can discourage their teenagers from participating. Ask parents to inform police about possible future street races that they hear about from their teenagers.

Place roadblocks leading to locations where street racing is most likely to occur. These locations should be supervised during prime hours for street racing.

Study solutions adopted elsewhere—in particular whether legal venues for street racing can be created, which can be more easily monitored and controlled.

46 SPRING BREAKS

THE ROOTS OF THE "SPRING BREAK" TRADITION CAN BE TRACED BACK TO THE FIRST COLLEGE SWIM FORUM, held in Fort Lauderdale in 1938. Since then, "spring break" has become a rite of passage among young college students across North America. It gained prominence through such films as *Where the Boys Are* (1960) and *Spring Break* (1983) and has been further popularized through MTV's "Spring Break" and the video series "Girls Gone Wild." Also, an industry of promoters of spring break trips advertise on college campuses.

Approximately half a million students each year vacation at popular spring break destinations. These include South Padre Island, Texas; Palm Springs, California; Fort Lauderdale, Daytona Beach, Pensecola, and Panama City Beach, Florida; and Lake Havasu, Arizona. Recent years have also seen increased numbers of students taking spring breaks in foreign destinations that include Cancun, Matzalan, and Acapulco, Mexico; as well as the Bahamas and Jamaica. Younger students may go to Mexico because of the lower legal drinking age of 18.

Students on spring break often engage in heavy alcohol consumption/binge drinking and some recreational drug use. One study at Panama City Beach found that an average male student had 18 drinks during the previous day, while an average female consumed 10 drinks. Binge drinking is higher among fraternity or sorority members, and among those who lead a party-centered lifestyle.

Students vacationing in groups are more likely to engage in pronounced substance abuse and in promiscuous sexual activity, which places them at a high risk of contracting sexually transmitted diseases. They might also engage in brawling, trespassing on waterfront properties, tearing down fences, and public urination.

Contributing factors

- A wish to get away from college and "winter blues"
- Opportunities afforded for easy socializing and new romantic involvements
- The anonymity afforded by spring breaks (at least in the minds of the students)
- The feeling of being a different person on holiday and, therefore, open to experiment with casual sex, drugs, and excessive drinking
- Commercial trip organizers encourage and facilitate visiting spring break destinations
- Commercial enterprises at resort destinations cater to spring break revelers

Examples of measures to curtail irresponsible behavior during spring breaks

Beachfront resorts in Destin, Florida, cooperated with local police by imposing a late night curfew on their private beaches during spring break. Several hotels floodlit their beaches to prevent trespassing, drinking, and other related behavior. In addition, police patrolled several miles of beach, concentrating where large crowds of teenagers might gather, stopping and making underage drinkers pour their beer onto the sand.

Police cameras were installed to monitor beaches and popular restaurants and bars in Sunset Beach, California. The police also increased uniformed and plainclothes patrols, set up DUI checkpoints, and enforced parking and traffic violations.

Residents of Pacific Beach, California, prevented a planned "pub crawl" by using a law prohibiting alcohol sales to intoxicated patrons. The organizers of the event pulled out after they received notice from the district's council member and the Department of Alcoholic Beverage Control, threatening to close down participating bars for 15 days should anyone be served alcohol who was already intoxicated.

Louisiana State University (LSU) held a "Smart & Safe Spring Break Festival" for students before spring break to provide them with abstinence information and information on health and safety issues. The university's police department deployed its motorcycle unit and K-9 bomb-sniffing dogs, performed intoxication demonstrations, and offered sign-ups for LSU's emergency text messaging and other services.

Inducements offered by bars to students at spring break

"all-you-can-drink" (generally a purchase of a meal is followed by unlimited beer and other alcoholic beverages)

"twofers" (offering two or more drinks for the price of one)

"coin nights" (involves flipping a coin, where the winner gets a free drink)

"ladies nights" (female customers are offered special discounts)

"bladder bursts" (promise of an enjoyable night—generally involving alcohol—where you don't want to miss anything by going to the bathroom)

"bar crawls" or **"bar hopping"** (going from one bar to another)

Operation Blitz' Em and Operation Spring Break in the Gold Coast, Australia, targeted speeding and drunk drivers during spring break. Random breath testing, unmarked cars, and speed cameras were deployed at hot spots and during high-risk times. Extra officers from the state traffic taskforce assisted local police.

What can you do?

Gather intelligence about the locations most likely to be visited by the students. Determine if these are mainly outdoors or indoors, and think of specific measures to address the issue based on the location type.

Identify bars with lenient underage drinking practices that might attract underage students during spring break.

Survey bars, restaurants, and motels that offer inducements to students at spring break and inform the owners and managers about possible dangers associated with these practices.

While students might bring their own drugs with them, there might be local supply sources that you need to identify and alert your police department about.

What can your agency do?

Control alcohol distribution by enforcing local ordinances against restaurant and bar owners, as well as alcohol vendors. Limit the number of liquor outlets during the spring break period. Working with vendors and bar owners to identify fake IDs can also help control underage drinking.

Establish police presence/visibility at and around locations identified as hot spots and monitor student behavior to ensure compliance with the law. The presence of uniformed police officers can help bring the situation under control by monitoring drinking, public nudity, drug use, and other related behaviors.

Partner with the local media to encourage and influence responsible student behavior while on spring break. Encourage the media to practice more socially responsible marketing efforts to promote healthier and safer spring break activities.

Local initiatives can involve offering financial rewards to individual "bounties" who report bars that serve intoxicated patrons, as well as underage students.

Provide free false-identification training for restaurant and bar employees to help reduce illegal sales to underage students.

Laws promoting responsible bar policies in certain states require servers, managers, and owners of restaurants and bars to attend a state-approved course every five years that includes information about alcohol's effect on the body, drunk-driving laws, effective server intervention techniques, and related topics. Similar programs can be implemented by your police department.

Warn potential offenders by posting signs specifying the ordinances (such as "nudity is prohibited in a public area") and that failure to follow these may lead to arrest.

Roads near the locations where spring breakers gather can be monitored by the police to discourage students from driving under the influence. Meanwhile, free shuttle services can be offered by the hotels to encourage safe travel. Consider closing certain streets.

Encourage universities to enforce disciplinary measures against students found to have engaged in binge drinking or drug use.

47 POLITICAL DEMONSTRATIONS

SINCE THE DEMONSTRATIONS AT THE 1999 MEETINGS OF THE WORLD TRADE ORGANIZATION IN SEATTLE, American police have increasingly been confronted with the problem of dealing with political protesters. There are four main kinds of political demonstrations:

1. **Marches**—proceeding from one location to another, such as the May 1, 2006, marches across the United States protesting the proposed immigration laws.
2. **Rallies**—gathering at a location to hear speakers or musicians, such as the November 3, 2007, student rally in Washington, D.C., to address issues on climate change and global warming.
3. **Picketing**—targeting a specific facility or building, such as the September 15, 2002, pickets at the Ukrainian Embassy in Washington, D.C., by the members of the Forum of Ukrainian Students of America, to honor Ukrainian journalists, and civil and political activists who had died after Ukrainian independence.
4. **Sit-ins/sit-downs**—nonviolent occupation of a building or public place and refusal to leave until demands have been met or an agreement reached. Sit-ins were widespread in the 1960s by African American college students across the United States campaigning to end racial segregation. A recent example is Occupy Wall Street in 2011.

Political demonstrations are generally peaceful, but violence and vandalism may occur, sometimes deliberately provoked by organizations such as the "Black Bloc", which exploit demonstrations to further their own political ends. Violent demonstrations are a particular problem for local police, as the inability to handle them properly may have serious implications for police-community relations.

The Black Bloc

- The Black Block is an international anarchist organization (also known as the Revolutionary Anti-Capitalist Bloc) started in Germany in 1987, which soon spread to the United States and Canada. Its unofficial center in America is Eugene, Oregon.
- It is best known for its violent demonstrations in Seattle in 1999 against the World Trade Organization. Other demonstrations include the 2001 demonstration at the Summit of the Americas in Quebec City, Canada; and the demonstrations in July 2001 in Genoa, Italy, at the General Assembly Summit. In recent years the Black Bloc has targeted such large American corporations as Banana Republic, Gap, Levi's, McDonald's, Old Navy, and Starbucks.
- Black Bloc protesters arrive at demonstrations dressed in three layers. The outermost layer is regular clothes worn at the beginning of the demonstration before the Black Bloc tactics are activated. The middle layer is all black clothing (and a black mask worn when the members are given the signal to engage in confrontation). The last layer involves regular clothes to escape from police.
- The Black Bloc often deploys in tight formations (in black) when confronting the police, or intimidating other groups.

Public-Order Policing

Aversion to disruption is used when police want to prevent demonstrations from interfering with the normal functioning of the city, for example, by denying the right to march on city streets and confining marches to sidewalks or to restricted areas and times of the day.

Controlling access involves the use of concrete or metal barriers to separate the protesters from the public and to control access through limited entry points.

Divide and conquer allows the police to have access to almost all parts of the demonstration by subdividing the crowds into smaller groups by the use of interlocking metal "french barriers." This makes it difficult for demonstrators to circulate freely, while allowing effective control of the crowds.

Shock and awe involves deploying a very large number of police officers to deter outbreaks of violence or other unlawful behavior. Police might employ less-than-lethal weapons to deal with protestors and commonly arrest leaders who promote violence or are themselves engaged in violence.

Zero tolerance involves the rigorous enforcement of legal statutes during demonstrations. Failure to comply with the provisions of a permit may be met by police in full riot gear shutting down sound systems and mass arrests of protesters at the expiration time of a permit to demonstrate.

Non-confrontational crowd management involves supporting the legitimate aims of demonstrators while avoiding confrontation that may alienate the crowd as a whole. Unruly or violent crowd members are carefully identified and removed by the police.

Dialogue policing is an extension of non-confrontational crowd management (Step 25). It aids communication between demonstrators and police commanders through specially-trained police officers in the crowd. This encourages self-policing among demonstrators, facilitates legitimate expression of freedom of speech and assembly, and prevents miscommunication between the police and demonstrators.

Source: Madensen and Knutsson 2010.

In most cases, your department will be called on to deal with smaller demonstrations that involve picketing or sit-ins. Sit-ins are common in administrative or congressional offices. For example, constituents may stage a sit-in in the office of their representative to protest his or her voting record. Sit-ins are especially common outside abortion and Planned Parenthood clinics.

Picketing is more common among employees who are dissatisfied with wages, long hours, working conditions, and related issues. Picketing will also sometimes be undertaken to block access to government buildings and corporations. Pickets are generally non-violent, but the police department's inability to handle the protests properly may lead to violent confrontations.

What can you do?

Stay informed about current political issues that may possibly become reasons for political demonstrations. Gather information on groups in your jurisdiction who are most likely to act on these issues. Study the backgrounds of these groups and determine their overall demonstration "style."

Political protesters use the Internet to voice their concerns, recruit new members, and to announce the locations and times where protests are to be held. Therefore, you can monitor the websites operated by these groups to gain understanding about their networks and activities. Some of these websites include:

- Infoshop www.infoshop.org
- Spunk Press www.spunk.org
- Anarchy Archives www.anarchyarchives.org
- Liberty for the People http://flag.blackened.net/liberty/liberty.html
- Noam Chomsky Archive www.zmag.org/chomsky/index.cfm
- Independent Media Center www.indymedia.org

Identify possible locations/targets, such as government buildings, corporate headquarters, financial institutions, and other symbolic buildings. Decide what strategies can be implemented and how these should differ from site to site and from group to group.

Gather information about strategies used by other police departments to handle similar situations. Determine if these strategies suit your police department's operational goals and whether any of the strategies would undermine community relations.

What can your agency do?

Police departments throughout the country have used a variety of approaches to control political demonstrators and other crowds (see *Public-Order Policing* on page 132). Which of these your department adopts in any particular situation may depend partly on its philosophy, but also on the groups they are dealing with.

Aggressive police intervention strategies may lead to violence in otherwise peaceful demonstrations, therefore, cooperative intervention is vital in controlling demonstrators. Keep in mind also, that advance changes to the setting can reduce damage. These include: blocking off streets and particular buildings; removing items such as building rubble that can be used as weapons; and temporary removal of street furniture such as trash cans that can be burned.

Lastly, your department can use electronic surveillance technologies to provide real-time information on demonstrations and quickly send in more police should the crowd turn violent.

48 STUDENT PARTY RIOTS

PARTIES ARE ALMOST SYNONYMOUS WITH STUDENT LIFE, BUT IF UNREGULATED, THEY CAN RESULT IN BEHAVIORS requiring police intervention. These behaviors include underage drinking, binge drinking, drunk driving, sexual misconduct, fighting, sexual assaults, drugs, violence, noise, litter, and vandalism.

Studies of blood alcohol concentration levels have found that students at fraternity parties get significantly more intoxicated than those at other parties. In one large study of 140 colleges, 44 percent of the students surveyed reported binge drinking and 19 percent were frequent binge drinkers—those who binged three or more times in two weeks.

Common features of student parties

- The students present are mostly young adults—some may be under 21
- Alcohol is generally consumed in large amounts and drugs may also be used
- The parties begin late at night and may continue into the early morning
- Males are most often responsible for fighting or destructive behavior
- The parties may result in noise complaints from local residents
- Drunk driving is common
- Students may engage in unplanned or unprotected sexual activity
- Other young adults not associated with the college may also gather at the parties
- Students may get into trouble with campus or local police

The "life cycle" of student parties

Madensen and Eck report that the larger parties have a "life cycle" of five stages, around which police should organize their responses (see Table 18 on page 135).

Examples of what has been done to address the problem

Michigan State University used campaigns designed to challenge the attitudes and expectations of students regarding "celebration drinking." The campaigns made use of student and local newspapers and incorporated the distribution of flyers in campuses, student residences, and at Greek Life fairs.

The Robert Wood Johnson Foundation funded "A Matter of Degree" (AMOD) to reduce high-risk drinking among college students, which resulted in significant changes in drinking behaviors and decreases in related drunk driving, wild party complaints, and charges of maintaining a disorderly house.

Some police departments offer the "Adopt-the-Cop" program. This makes a police officer available at student gatherings to serve as a mentor and advisor to ensure compliance with city and college requirements for student parties.

In Minnesota, the Winona City Council passed an ordinance to control and track keg distribution. Anyone purchasing two or more half-barrels of beer in a residentially zoned area was required to obtain council approval, and liquor retailers were required to keep detailed records of barrels sold.

Rutgers University enforces good behavior at Greek parties through its Board of Control, which comprises fraternity and sorority students who check on parties in progress to ensure there is no vandalism, sexual misconduct, fighting, or other misbehavior. Local police train these students in how to handle violent situations, write up violations of school policy, and call the police in case of violence. Parties are limited to Friday and Saturday nights and require registration with the Fraternity Affairs Office and the local police department. The Board of Control checks out the party

Table 18. Five stages of large parties

STAGE	SUGGESTED RESPONSES
1. Initial Planning. Deciding to host a party, when and where; deciding whom to invite and how to invite them. Students are invited through flyers posted months in advance, word of mouth, or simple cues indicating that there will be a student party/gathering somewhere soon.	Create a multi-agency task force with other community stakeholders, most importantly with the college concerned. Require a permit for a party of more than a few friends. Assign police officers as advisors to hosts of gatherings.
2. Preassembly preparation. Obtaining alcohol and food by hosts or guests before the party.	Ask students to participate in "student patrols" by establishing "peer security" groups within the gathering. Monitor advertisements for gatherings.
3. Assembling process. Heading for the party. Students may drive, take a taxi or bus, or simply walk to the location.	Facilitate orderly gathering by providing transportation to the event. Establish a positive police presence, intended to reduce anonymity for police and students and enhance communication. Establish gathering perimeters in order to gain control of disturbances.
4. Assembled gathering. Having congregated, students talk, drink, and possibly engage in other behaviors associated with student parties.	Use alternative deployment methods, such as horses and bike patrols. Videotape the party to reduce anonymity. Develop a standard operating procedure in case of a disturbance.
5. Dispersal process. The party is over and students return to their dorms or apartments. Drunk driving may be a problem if students have reached the party in their own vehicles.	Provide transportation from the event to dorms or other centralized locations. Ask people to leave when the party is over.

Source: Madensen and Eck 2006.

three times a night, between the hours of 10:00 PM and 2:00 AM, where a checklist is completed about control measures such as checking IDs, using stamps or bracelets to identify guests, and keeping the noise down.

What can you do?

Study local college policies on controlling student parties and make contact with university administration should you need to find out more about these policies and how they are enforced.

Work closely with campus police or security to gather information on upcoming parties by monitoring student newspapers and student postings at college campuses.

Work with local student organizations to gather information about times of the day and days of the week parties are most likely to be held, how long they last, types of drinks consumed, how alcohol is obtained, whether drinking games are played, and any associated problematic behaviors.

Make contact with local college fraternities and sororities to find out more about the policies currently used to monitor and control Greek parties.

What can your agency do?

Discuss the alcohol policies effective on campus with local college administrators and suggest possible improvements should you find the college has problems effectively controlling student parties. Organize regular meetings/presentations on college campuses to discuss the dangers associated with irresponsible behavior at student parties.

Encourage colleges to give warnings and impose disciplinary actions against students who are engaged in disorderly conduct, violence, or other behaviors associated with student parties.

Form a partnership with student organizations and campus police/security to promote a safe party environment and responsible behavior at student parties. At the beginning of each academic year, discuss alcohol laws, off campus behavior, and other safety issues related to student parties with fraternity and sorority presidents.

Make clear to local bars, restaurants, and liquor outlets that sales to underage students will not be tolerated. Promote responsible beverage services, strengthen enforcement of drunk driving laws, and, where necessary, seek changes in local zoning ordinances to reduce the density of alcohol sales outlets.

Work with local rental property owners to require them to provide safe and secure apartments to students living off campus. Encourage them to call police in the event of problematic parties being held in their apartments.

About the Authors

John E. Eck

John Eck is a criminal justice professor at the University of Cincinnati, where he teaches police effectiveness, research methods, and crime prevention. His research has focused on the development of problem-oriented policing, police effectiveness, crime patterns, and crime prevention. Dr. Eck was a member of the National Academy of Science's Committee to Review Research on Police Policy and Practices. With Ronald Clarke, he authored *Crime Analysis for Problem-Solvers: In 60 Small Steps*. He is also the author of many publications on problem-oriented policing, crime mapping, and crime prevention, some written for the Center for Problem-Oriented Policing. Dr. Eck received his bachelor's and master's degrees from the University of Michigan, and his doctorate from the University of Maryland's Department of Criminology.

Ronald V. Clarke

Ronald Clarke is university professor at Rutgers University and associate director of the Center for Problem-Oriented Policing. He was previously head of the British government's criminological research department, where he had a significant role in the development of situational crime prevention and the British Crime Survey. Dr. Clarke is the founding editor of *Crime Prevention Studies*, and his publications include *Designing out Crime* (HMSO 1980), *The Reasoning Criminal* (Springer-Verlag 1986), *Situational Crime Prevention: Successful Case Studies* (Harrow and Heston 1997), *Superhighway Robbery: Preventing E-commerce Crime* (Willan Publishing 2003), *Outsmarting the Terrorists* (Praeger 2006), and with John Eck, *Become a Problem Solving Crime Analyst* (U.S. Department of Justice 2005). He was formerly chair of the selection committee for the annual Herman Goldstein Award for Excellence in Problem-Oriented Policing.

Gohar Petrossian

Gohar Petrossian is an assistant professor at John Jay College of Criminal Justice. She is the author of *Export of Stolen Vehicles across Land Borders* (Problem-Specific Guide No. 63, with Ronald V. Clarke), co-author of *Shoplifting (2nd Edition)* (Problem-Specific Guide No. 11, with Ronald V. Clarke), and scholarly articles published in *Journal of Experimental Criminology* and *Security Journal*. She holds a doctorate in criminal justice from the School of Criminal Justice, Rutgers University-Newark, and a master's in criminal law and procedure from John Jay College of Criminal Justice.

KNOWING HOW INTELLIGENCE ANALYSIS CAN HELP SOLVE PROBLEMS and how problem solving can improve the effectiveness of intelligence analysis will aid any police practitioner interested in reducing crime or disorder. *Intelligence Analysis for Problem Solvers* fuses aspects of intelligence analysis with Problem-Oriented Policing. It is focused on the analysis of intelligence and has been written for three groups in local policing agencies: (1) intelligence officers and analysts, (2) crime analysts who may be called upon to use intelligence information and, (3) police managers who supervise crime and intelligence analysts.

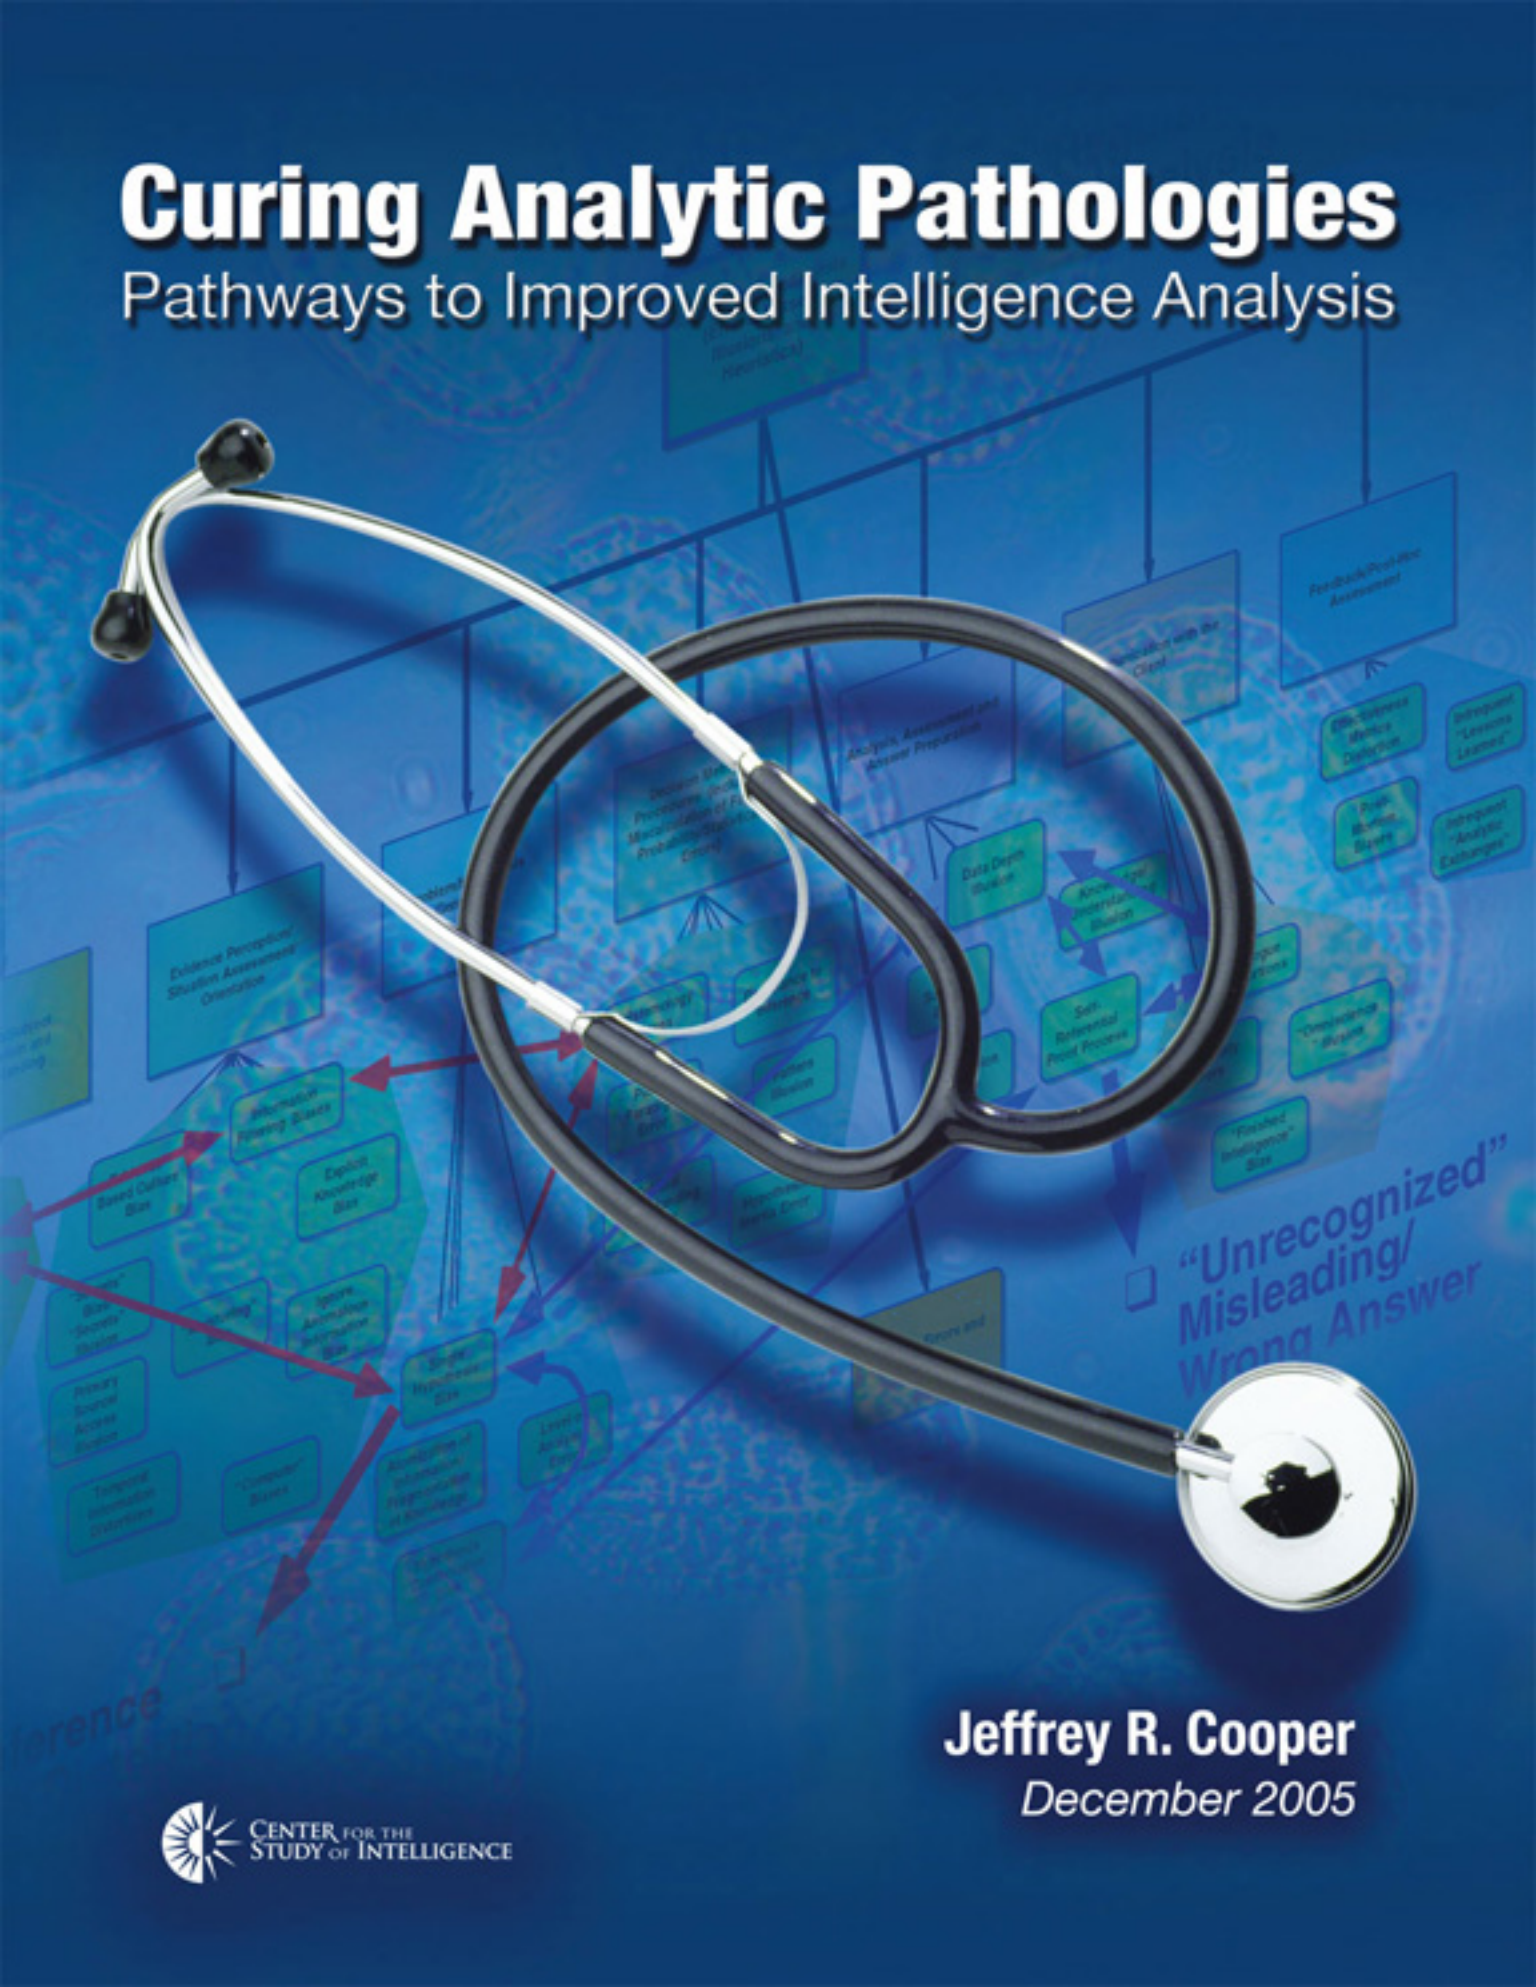
Curing Analytic Pathologies

Pathways to Improved Intelligence Analysis



Jeffrey R. Cooper

December 2005

Center for the Study of Intelligence

All statements of fact, opinion, or analysis expressed in this study are those of the author. They do not necessarily reflect official positions or views of the Central Intelligence Agency or any other US Government entity, past or present. Nothing in the contents should be construed as asserting or implying US Government endorsement of the study's factual statements and interpretations.

Curing Analytic Pathologies

The Center for the Study of Intelligence (CSI) was founded in 1974 in response to Director of Central Intelligence James Schlesinger's desire to create within CIA an organization that could "think through the functions of intelligence and bring the best intellects available to bear on intelligence problems." The Center, comprising professional historians and experienced practitioners, attempts to document lessons learned from past activities, explore the needs and expectations of intelligence consumers, and stimulate serious debate on current and future intelligence challenges.

In carrying out its mission, CSI publishes *Studies in Intelligence*, as well as books and monographs addressing historical, operational, doctrinal, and theoretical aspects of the intelligence profession. It also administers the CIA Museum and maintains the Agency's Historical Intelligence Collection.

Other works recently published by CSI include:

Analytic Culture in the U.S. Intelligence Community, by Dr. Rob Johnston (2005)
Directors of Central Intelligence as Leaders of the U.S. Intelligence Community, 1946–2005 (2005)
U.S. Intelligence Community Reform Studies Since 1947, by Michael Warner and J. Kenneth McDonald (April 2005)
Intelligence and Policy: The Evolving Relationship (June 2004)
Intelligence for a New Era in American Foreign Policy (January 2004)

Curing Analytic Pathologies: Pathways to Improved Intelligence Analysis

JEFFREY R. COOPER

December 2005

Acknowledgments

The journey that produced this study owes much to many people. Some of them can be named, others cannot; but all of them have my deepest appreciation and deserve to be acknowledged for their support in this effort. And to my wife Lisa, who can be named—special thanks for putting up with me throughout.

I began to appreciate the depth of the Intelligence Community's analytic problems during a series of research and analysis efforts for various of its components starting in the mid-1990s, and I would like to thank the sponsors of those many efforts even though they cannot be named. Frank Jenkins, General Manager of Science Applications International Corporation (SAIC) Strategies Group, deserves special praise for allowing Fritz Ermarth and me to follow our instincts and start to investigate these issues before the failures became so very public. Particular thanks are owed to Henry Abarbanel for a discussion of the contrasts between the practice of science and that of intelligence analysis, a conversation that prompted me to focus on the deep cultural and process factors that affect analytic efforts rather than on the superficial symptoms and manifestations of the failures.

I owe a debt to Mike May, Dean Wilkening, and Scott Sagan of Stanford University's Center for International Security and Cooperation (CISAC) for inviting me to give a seminar on intelligence issues that forced me to organize and sharpen my concerns into the original briefing on "Analytic Pathologies," and I am truly grateful to both Aris Pappas and Stan Feder for reviewing that lengthy presentation slide by slide. Paul Johnson, Director of the Center for the Study of Intelligence, has my appreciation for an invitation to CSI's 2003 conference on "Intelligence for a New Era in American Foreign Policy"; as do the many intelligence professionals at that conference who helped by bringing their concerns into the open. I want to thank the members of the Marriott Group on the Revolution in Intelligence Affairs, as well as David Kay, Mike Swetnam, Gordon Oehler, and Dennis McBride of the Potomac Institute for providing forums for discussion and for helping me think through these issues with their insider perspectives. Thanks are also owed to several former senior intelligence officials who then pushed me to go beyond diagnosis and address the harder questions of fixing the problems.

I want to thank the Commissioners and my fellow staff members of the President's Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction (the Silberman-Robb Commission) for the lengthy opportunity to delve into these issues, examine them in great depth, and analyze them within a truly professional search for understanding. I am also grateful to both the former and the current Program Managers, Lucy Nowell and Rita Bush, of Advanced Research and Development Activity's (ARDA's) Novel Intelligence from Massive Data (NIMD) Program, as well as my team partners on that effort—Stuart Card, Peter Pirolli, and Mark Stefik from the Palo Alto Research Center (PARC) and John Bodnar from SAIC—for discussions and research that led to significant insights on current practices of analysis. I must again thank Paul Johnson and CSI for providing the opportunity to publish this study and reach a far broader audience; without that spur, I would not have completed it. And to the CSI editors, Mike Schneider and Andres Vaart, my appreciation for their great help in getting me through this entire process and in substantially improving this monograph.

Beyond those I have already mentioned, I am also truly obligated to a large number of busy people who took the time and made the serious effort to read and review the earlier briefing and draft study, as well as to share their perspectives and thoughts. Their comments and suggestions were crucial to producing what I hope is a coherent structure and argument: Art Kleiner, Dan Cohen, Jeffrey Pfeffer, Charles Sabel, Dick Kerr, Stephen Marrin, Bill Nolte, Harry Rowen, Mike Mears, Bruce Berkowitz, Mike Warner, Deborah Barger, Joe Hayes, Bill Studeman, Russ Swenson, Ed Waltz, Frank Hughes, Carol Dumaine, David Moore, Rob Johnston, Mark Lowenthal, Kevin O'Connell, Carmen Medina, Jim Bruce, Joe Keogh, Greg Giles, Winsor Whiton, Bob Cronin, Gilman Louie, and John Seely Brown. In addition, many thanks are due Emily Levasseur, my former research assistant, for her invaluable contribution in helping me to conduct the research, find important sources and citations, review thousands of pages of source materials, organize and edit, and revise numerous drafts—all in good humor.

Finally, I give my sincerest apologies if I have forgotten anyone who contributed time and effort to this project. For any errors of omission or commission, I have only myself to hold responsible.

Foreword

Dear reader, my task in this foreword is to shackle your attention to the challenge of getting through Jeffrey Cooper's monograph that follows.

Your attention is deserved because the subject—what we label with deceptive simplicity "intelligence analysis"—is so important and so interesting. The scope of this monograph, like that of the analytic profession, is broad and deep, from support to military operations to divining the inherently unknowable future of mysterious phenomena, like the political prospects of important countries. Jeff Cooper's study, as befits the work of one who has long been an acute observer of the Intelligence Community and its work, is packed with critiques, observations, and judgments. It would be even more satisfying if the study could be further illuminated by clinical case studies of failures and successes. In principle, this lack could be remedied if the hurdle of classification could be cleared. In practice, it cannot currently be fixed because an adequate body of clinical, diagnostic case studies of both successes and failures and lessons learned, particularly from the most relevant, post-Cold War intelligence experience, simply does not now exist. Not surprisingly, Mr. Cooper, along with many other critics and reformers, such as the Silberman-Robb Commission (of which he was a staff member), recommends the institutionalization of a lessons-learned process in our national intelligence establishment. This is but one of a rich menu of admonitions to be found in this study.

Mr. Cooper has provided a good, thematic summary of the main points of his monograph. I shall not attempt to summarize them further in this foreword. But some overview comments are in order.

This study is fundamentally about what I would call the intellectual professionalization of intelligence analysis. It is about standards and practices and habits of mind. It is about inductive (evidence-based) analytical reasoning balanced against deductive (hypothesis-based and evidence tested) reasoning. It extols the value of truly scientific modes of thinking, including respect for the role of imagination and intuition, while warning against the pitfalls of "scientism," a false pretense to scientific standards or a scientific pose without a scientific performance. It talks about peer review and challenging assumptions and the need to build these therapeutic virtues into the analytical process.

Mr. Cooper makes reference to the standards and practices of other professions with a high order of cerebral content, such as law and medicine. Other recognized authors, such as Stephen Marrin and Rob Johnston, have written persuasively on this theme. I am struck by how frequently Mr. Cooper—and others—refers to the example of medicine, especially internal medicine, which has much to offer our discipline. But I am not surprised. When I was very young in this business, I was fretting about its difficulties in the company of my uncle, an old and seasoned physician. He walked to his vast library and pulled out for me a volume, *Clinical Judgment*, by Alvan Feinstein, a work now often cited by intelligence reformers. I later asked my mother, my uncle's younger sister, what made Uncle Walt such a great doctor. Her answer: He always asks his patients at the beginning, "how do you feel?" and he never makes it home for dinner on time. The model of internal medicine is a great one for critical emulation by intelligence analysis: science, training, internship, expertise, experience, and then seasoned judgment, intuition, unstinting diligence, and valued second opinions.

Most of what Mr. Cooper writes about concerns the intellectual internals of good intelligence analysis, i.e., standards, methods, the tool box of techniques, and the vital element of attitude toward understanding and knowledge building. With somewhat less emphasis but to good effect, he also addresses what might be called the environmental internals of the same: training, mentoring, incentives, management, and leadership. It is in this dimension that we must overcome the plague recognized by all informed critics, the tyranny of current intelligence, and restore the value of and resources for deep analysis.

This leads to a consideration of the “externals” of good intelligence analysis. To wit:

The full scope of analysis: This has to be appreciated for things to come out right. Analysis is not just what a hard-pressed analyst does at his desk. It is the whole process of cerebration about the mission and its product. This applies to not only the best answer to a current intelligence question on the table, but to establishing priorities, guiding collection, and, especially, to judging whether the best effort on the question of the day is good enough to support the weight of the situation and the policy decisions that have to be made.

Money and people: There is no gainsaying that a lot of our failings after the Cold War are the fault of resource and personnel cuts while old and new and more equally competing priorities were proliferating. We've got to fortify the bench strength of intelligence analysis. The president has called for that. Without improved practices, however, new resources will be wasted. We press for improved practices; but they need more resources to be implemented effectively.

External knowledge environments: Half a century ago, when the United States came to appreciate that it faced an enigmatic and dangerous challenge from the Soviet Union, it invested seriously in the building of knowledge environments on that subject, in the government, in think tanks, in academia, and in other venues. These external sources of expertise, corrective judgment, and early warning proved vital in keeping us on track with respect to the Soviet problem. We have yet to get serious about building such knowledge environments for the challenges of proliferation and, especially, concerning the great struggle within the world of Islam, from which the main threat of terrorism emerges. Related to this, Mr. Cooper's study properly places great importance on our improving exploitation of open sources.

Information security regimes: We are talking here about a complicated domain from classification to recruitment and clearance systems. What we have is hostile to the task of developing a comprehensive, communitywide knowledge base and operational efficacy in the age of information and globalization. We need to be more open on a lot of things, especially where the original reason for secrecy perishes quickly and the value of openness is great (as during the Cold War in regard to Soviet strategic forces), and to tighten up on secrecy where it is vital, for example, in protecting true and valuable cover.

One final—and perhaps most important—point: Mr. Cooper's study of intelligence analysis is shot through with a judgment that is shared by almost every serious professional I've heard from in recent years. And it applies to collection and other aspects of national intelligence as well. We cannot just rely on the new Director of National Intelligence (DNI) superstructure to put things right with our national intelligence effort. The problems and pathologies that inhibit

our performance and the opportunities for radically improving that performance are to be found down in the bowels and plumbing of this largely dutiful ship we call the Intelligence Community, and that is where we must studiously, and with determination, concentrate our efforts and our money.

—Fritz Ermarth[1]

Introduction

As a result of a number of analytic projects for different intelligence agencies, a major focus of my work during the past several years has involved examining the practice of analysis within the US Intelligence Community.[1] This study was prompted by a growing conviction—shared by others, to be sure—that improving the analytic products delivered by Intelligence Community components had to begin with a critical and thorough appraisal of the way those products are created. A conversation with a physicist friend in 2002 had triggered thoughts on several basic differences between the practice of science and intelligence analysis. Shortly thereafter, an invitation to give a seminar on intelligence analysis at Stanford University led me to prepare a briefing entitled "Intelligence and Warning: Analytic Pathologies," which focused on a diagnosis of the problems highlighted by recent intelligence failures.[2] As Donald Stokes noted in his seminal book on science and technological innovation, *Pasteur's Quadrant*, "Pathologies have proved to be both a continuing source of insight into the system's normal functioning and a motive for extending basic knowledge."[3]

The Analytic Pathologies framework yields four insights that are crucial both to accurate diagnosis and to developing effective remedies. First, the framework enables analysts to identify individual analytic impediments and determine their sources. Second, it prompts analysts to detect the systemic pathologies that result from closely-coupled networks and to find the linkages among the individual impediments. Third, it demonstrates that each of these networks, and thus each systemic pathology, usually spans multiple levels within the hierarchy of the Intelligence Community. Fourth, the framework highlights the need to treat both the systemic pathologies and the individual impediments by focusing effective remedial measures on the right target and at the appropriate level.

In response to presentations to community audiences, a number of senior intelligence officials subsequently recommended that I use the diagnostic framework of the briefing to develop corrective measures for the dysfunctional analysis practices identified there. I circulated the resulting draft for comment and was delighted to receive many useful suggestions, most of which have been incorporated in this version.

---

[1] Although this paper will use the common terminology of "Intelligence Community" (IC), it is worth noting that the agencies of which it is composed seldom exhibit the social cohesion or sense of purpose that a real community should. A more appropriate term might be "intelligence enterprise," which is defined in Webster's Third International edition as "a unit of economic or business organization or activity."

[2] The briefing was first presented in early November 2003 to a seminar at Stanford University's Center for International Security and Cooperation (CISAC) and was revised for a Potomac Institute seminar on the "Revolution in Intelligence Affairs" on 17 May 2004. It will be cited hereafter as "Analytic Pathologies Briefing."

[3] Donald E. Stokes, *Pasteur's Quadrant: Basic Science and Technological Innovation.*

Several knowledgeable readers of the draft also raised the issue of the intended audience, strongly suggesting that this should be the senior decisionmakers, in both the Executive Branch and Congress, who could take action to implement the ideas it presented. They also pointedly recommended that the study be substantially condensed, as it was too long and "too rich" for that readership. That audience is, after all, composed of very busy people.

From the beginning, however, I have intended this study to serve as a vehicle for an in-depth discussion of what I believe to be the real sources of the analytic pathologies identified in the briefing—the ingrained habits and practices of the Intelligence Community's analytic corps—and not the organizational structures and directive authorities that are the focus of most legislative and executive branch reformers. Thus, my intended audience has been the cadre of professional intelligence officers who are the makers and keepers of the analytic culture. Without their agreement on causes and corrective measures, I believe real transformation of intelligence analysis will not occur.

Moreover, during the writing of this study, I was fortunate enough to serve on the selection panel for the inaugural Galileo Awards.[4] One of the winning papers focused on a similar issue—the appropriate audience for intelligence—and this reinforced my original inclination.[5] I have decided, therefore, not to condense this study in an effort to fit the time constraints of very high-level readers. I hope, instead, that the summary that follows this introduction proves sufficiently interesting to tempt them to tackle the remainder of the study, where the logic chains that I believe are necessary to convince intelligence professionals of the correctness of the diagnosis and the appropriateness of the suggested remedies are laid out in detail.

[4] The Galileo Awards were an initiative of DCI George Tenet, who, in June 2004, invited members of the Intelligence Community to submit unclassified papers dealing with all aspects of the future of US intelligence. DCI Porter Goss presented the first awards in February 2005.

Summary

Observations

A wide range of problems has contributed to the unease currently pervading the Intelligence Community;[1] a significant number of the most serious result from shortcomings in intelligence analysis rather than from defects in collection, organization, or management.[2] The obvious and very public failures exemplified by the surprise attacks of 11 September 2001 and by the flawed National Intelligence Estimate (NIE) of 2002 on Iraqi weapons of mass destruction (WMD) have resulted in a series of investigations and reports that have attempted to identify the causes of those failures and to recommend corrective actions.[3] These recommendations have usually emphasized the need for significant modifications in the organizational structure of the Intelligence Community and for substantial enhancements of centralized authorities in order to better control and coordinate the priorities and funding of community entities. The Intelligence Reform and Terrorism Prevention Act (IRTPA) of 2004, which created the office of Director of National Intelligence (DNI), was based on such foundations.[4]

The logic of this study differs from most of those recommendations with respect to both causes and corrective measures. The key observations in the original "Analytic Pathologies" briefing point in a fundamentally different direction for the root causes of the failures and for fixing the manifest problems. Most importantly, these observations lead to the conclusion that the serious shortcomings—with particular focus on analytic failures—stem from dysfunctional behaviors and practices *within* the individual agencies and are not likely to be remedied either by structural changes in the organization of the community as a whole or by increased authorities for centralized community managers. Those key observations, which follow, provide the conceptual foundation for this study.

1. There has been a series of serious strategic intelligence failures. Intelligence support to military operations (SMO) has been reasonably successful in meeting the challenges on the tactical battlefield of locating, identifying, and targeting adversary units for main force engagements. Similar progress in supporting counterterrorism operations has been claimed.[5] At the same time, however, other military and national users have been far less well served by the Intelligence Community across a range of functions. There have been significant shortfalls in support to post-conflict security and stabilization operations and

reconstruction efforts in Iraq. Analytic support has also come up short both in accurately capturing adversary thinking and intentions and in providing intelligence that identifies and characterizes developing strategic challenges, such as WMD.[6]

Moreover, within the past decade and a half, a series of intelligence failures at the strategic level, including serious failures in operational and strategic warning, have highlighted real weaknesses at this level and undercut the confidence of principal national users in the community's capabilities against important intelligence targets. These failures include Iraqi WMD developments (1991 onward), the global black-market in WMD, strategic terrorism (beginning with the attack on the World Trade Center in 1993), the North Korean nuclear program (1994), the emergence of globally-networked Islamic fundamentalism (1996 onward), the Indian and Pakistani nuclear programs (1998),[7] the 9/11 attacks (2001), and Iran's WMD programs (2002). Similar failures, as well as an apparent inability to provide accurate assessments and estimates on other important issues, such as the nuclear forces and strategies of China and Russia, affect national users at the highest levels and outweigh any increases in effectiveness at the tactical level.

Indeed, as a bottom-line assessment, this study contends that the Intelligence Community has been least successful in serving the key users and meeting the primary purposes for which the central intelligence coordinating apparatus was created under the National Security Act of 1947.[8] These principal officials are the president and his cadre of senior national security policymakers, not the departmental and battlefield users. As a senior intelligence official recently reminded us, those objectives were two-fold: not only to provide "strategic warning" in order to prevent another surprise such as Pearl Harbor, but also to help head off long-term challenges through a better understanding of the emerging strategic environment.[9]

***2. These failures each have particular causes, but the numerous individual problems are* interrelated.** These failures did not have a single locus—they occurred in technical collection, human source reporting, and analysis, among other critical functions—but neither do they reflect a series of discrete, idiosyncratic problems. Instead, they resulted from deep-seated, closely-linked, interrelated "systemic pathologies" that have prevented the Intelligence Community from providing effective analytic support to national users, especially effective anticipatory intelligence and warning.[10] The Intelligence Community's complicated

[6] It appears, for example, that the intelligence needed to support the security and stabilization operations in Iraq with effective "cultural awareness" during the post-conflict "Phase IV" has been far less than adequate. See comments by senior military officers at a conference in Charlottesville, Virginia, sponsored by CIA's Center for the Study of Intelligence (CSI). *Intelligence for a New Era in American Foreign Policy,* (hereinafter cited as *Charlottesville Conference Report*), 3–5.

[7] Perhaps the more serious error in the case of the Indian-Pakistani nuclear tests was not the failure to predict the timing of the catalytic Indian test (which was really more a failure by policymakers); arguably, it was the failure to estimate correctly the scale and status of the Pakistani weapons program, including its links to the global WMD black market.

[10] The systemic pathologies are discussed in detail in Chapter Three.

organizational structure and the accreted practices of its analysts have combined to create what Charles Perrow calls “error-inducing systems” that cannot even recognize, much less correct their own errors.[11]

3. The Intelligence Community still relies on the same* collection paradigm *created for “denied areas.” Remote technical collection and targeted human access were appropriate means of penetrating denied areas and obtaining critical intelligence against a bureaucratized, centralized, and rigid superpower adversary that exhibited strongly patterned behavior. The problem presented by many of the new threats, whether from transnational terrorist groups or from non-traditional nation-state adversaries, however, is not that of accessing denied areas but of penetrating “denied minds”—and not just those of a few recognized leaders, but of groups, social networks, and entire cultures. Unfortunately, information for intelligence is still treated within the old “hierarchy of privilege” that emphasized “secrets” and was more appropriate for a bureaucratized superpower adversary who threatened us with large military forces and advanced weapons systems.[12] Without refocusing its energies, the Intelligence Community will continue to do better against things than against people.

4. Analytic* methods *also have not been updated from those used to fight the Cold War. There were intelligence failures during the Cold War, but the United States and its allies managed to stay on top of the challenge presented by our principal adversary. A relatively stable threat (and consistent single target) allowed the Intelligence Community to foster in-depth expertise by exploiting a very dense information environment, much of which the opponent himself created. That “Industrial Age” intelligence production model—organized for efficiency in high-volume operations and fed by large-scale, focused, multiple-source collection efforts conducted mostly with episodic “snapshot” remote systems that were very good at big fixed targets—built a solid foundation of evidence. This knowledge base allowed analysts to cross-check and corroborate individual pieces of evidence, make judgments consistent with the highest professional standards, and appreciate and communicate any uncertainties (both in evidence and inference) to users. In particular, this dense information fabric allowed analysts to place sensitive intelligence gathered from human sources or by technical means within a stable context that enabled confirmation or disconfirmation of individual reports. As national security challenges evolved during the years following the collapse of the Soviet Union, however, continued reliance on the Cold War intelligence paradigm permitted serious analytic shortfalls to develop.

5. The Intelligence Community presently lacks many of the scientific community's self-correcting features. Among the most significant of these features are the creative tension between “evidence-based” experimentalists and hypothesis-based theoreticians, a strong tradition of “investigator-initiated” research, real “horizontal” peer review, and “proof” by independent replication.[13] Moreover, neither the community as a whole nor its individual

analysts usually possess the ingrained habits of systematic self-examination, including conducting "after action reviews" as part of a continual lessons-learned process, necessary to appreciate the changes required to fix existing problems or to address new challenges.[14]

6. Intelligence analysis remains a "craft culture," operating within a guild structure and relying on an apprenticeship model that it cannot sustain.[15] Like a guild, each intelligence discipline recruits its own members, trains them in its particular craft, and inculcates in them its rituals and arcana. These guilds cooperate, but they remain distinct entities. Such a culture builds pragmatically on practices that were successful in the past, but it lacks the strong formal epistemology of a true discipline and remains reliant on the transmission, often implicit, of expertise and domain knowledge from experts to novices. Unfortunately, the US Intelligence Community has too few experts—either analytic "masters" or journeymen—left in the ranks of working analysts to properly instruct and mentor the new apprentices in either practice or values.

Conclusions

The Intelligence Community is not normally self-reflective and usually avoids deep self-examination, but recognition and acceptance of the seriousness of its problems by all levels of the community is a necessary prerequisite for true change, including significant modifications to current organizational cultures and ethos. Agreement on the basic diagnosis must, therefore, precede detailed propositions about effective remedies. I suggest that the following six premises, first articulated in the "Analytic Pathologies" briefing, summarize the most important conclusions to be drawn from the preceding discussion of the current enfeebled state of the Intelligence Community.

***1. The dysfunctional practices and processes that have evolved within the culture of intelligence analysis go well beyond the classic impediments highlighted by Richards Heuer in* The Psychology of Intelligence Analysis.**[16] A more effective analytic paradigm must be built that incorporates the best analytic methods from modern cognitive science and employs useful and easily usable supporting tools to overcome these impediments and prevent them from combining into systemic pathologies.

---

[13] "Evidenced-based" analysis is essentially inductive; "hypothesis-based" is deductive; they should be seen as complementary approaches, not competitors for ownership of the analytic process.

[14] For an exception, see John Bodnar, *Warning Analysis for the Information Age: Rethinking the Intelligence Process*. In fact, both the Joint Military Intelligence College (JMIC) and the Center for the Study of Intelligence have programs to create a discipline of intelligence by bringing together intelligence theory and practice. Regrettably, the results of these efforts have not yet penetrated the mainline analytic units.

[15] In fact, the analytic community self-consciously characterizes its practices and procedures as "tradecraft."

[16] Richards J. Heuer Jr., *The Psychology of Intelligence Analysis*. Building on the work on cognitive impediments to human judgment and decisionmaking of Daniel Kahneman, Amos Tversky, and others, in addition to his own long experience as a senior intelligence analyst, Heuer highlighted many psychological hindrances to making accurate judgments by individuals and small-groups.

2. More corrosively, the individual impediments form interrelated, tightly-linked, amplifying networks that result in extremely dysfunctional analytic pathologies and pervasive failure. A thorough reconceptualization of the overall analysis process itself is needed. The new approach would incorporate a better connected, more interactive, and more collaborative series of networks of intelligence producers and users. In addition, it must be designed to detect and correct errors within routine procedures, instead of leaving them to be found by post-dissemination review.

3. The new problems and circumstances call for fundamentally different approaches in both collection and analysis, as well as in the processing and dissemination practices and procedures that support them. It is clear that serious problems in the existing organizational structure of the Intelligence Community are reflected in poor prioritization, direction, and coordination of critical collection and analysis activities. However, many problems that are more fundamental and deep-seated exist inside the organizational "boxes" and within the component elements of the intelligence agencies themselves. Fixing these—dysfunctional processes, ineffective methods, and ingrained cultures—is not solely a matter of increased authorities, tighter budgetary control, or better management. A strategic vision that addresses the systemic pathologies, leadership that understands how key functions ought to be improved, and a sustained long-term commitment to rebuilding professional expertise and ethos will be essential.

4. Accurate diagnosis of the root causes of problems "inside the boxes" is required; otherwise remedies will be merely "band-aids." For example, the analytic problems occur at and among four organizational levels: 1) individual analysts; 2) analytic units, including their processes, practices, and cultures; 3) the individual intelligence agencies; and 4) the overall national security apparatus, which includes the entire Intelligence Community in addition to the executive bodies responsible for making policy. Solving problems at all four of these interlocking levels requires an integrated attack that includes solutions addressed to the right level and tailored for each problem element.

5. The Intelligence Community must bring more perspectives to bear on its work and create more effective "proof" and validation methods in constructing its knowledge. It should, in particular, adopt proven practices from science, law, and medicine, including more open communication and self-reflection.

6. Whatever the details of structures or authorities, the new Director of National Intelligence (DNI) leadership must assure that the corrective measures are implemented within each agency and across the community. Moreover, all this should be done in the knowledge that change will be continual and that there will be no static resting place where the "right" solutions have been found; organizational structures and processes must be designed to evolve with and adapt to that realization.[17]

Recommendations

Curing the flaws in intelligence analysis will require a sustained emphasis on rebuilding analytic capabilities, refocusing on human cognitive strengths enhanced by innovative support tools, and restoring professional standards and ethos among the analysts

themselves. Most of the recent reform recommendations notwithstanding, more guidelines and tighter management oversight are no substitute for analytic expertise, deep understanding, and self-imposed professional discipline—all achieved not only by formal education and training, but also through assimilation from following experienced mentors. Moreover, neither curiosity nor expertise on the part of the individual analysts can be restored by directives from the top; they must come from an appropriate recruiting profile, effective training, continual mentoring at all levels, time to learn and practice the craft of analysis—both individually and collaboratively—and constraining the "tyranny of the taskings" that prevents analysts from exercising curiosity and pondering more than the obvious answer.[18]

To ensure that the Intelligence Community can provide more effective capabilities to meet the increasingly complex challenges of 21st-century security issues, this study recommends rebuilding the overall paradigm of intelligence analysis from its foundations. The essential components of this effort are:

1. ***A revamped analytic process;***

2. ***An entirely revised process for recruiting, educating, training, and ensuring the professional development of analysts (including the essential aspect of mentoring);***

3. ***Effective mechanisms for interactions between intelligence analysts and users;***

4. ***A proper process for "proof," validation, and review of analytic products and services;***

5. ***An institutionalized lessons-learned process;***

6. ***Meaningful processes for collaboration within the Intelligence Community.***

Furthermore, although implementing each of these processes separately would produce significant improvements in the quality of analysis, a more effective approach would be to mount a broad-gauged, systematic, and integrated effort to deal with the entire analysis process.

[17] A medical analogy might make this argument clearer. Although a low-cholesterol diet, proper exercise, routine physicals, a low dose of aspirin, and moderate intake of alcohol may be useful over the long-term for preventing heart disease, patients in acute cardiac distress require more forceful intervention to save them. The measures listed above would have been useful before the attack, and they may be appropriate after recovery, but they are not effective during an acute crisis or in the immediate aftermath, when patients must be kept under observation to be certain they are "taking their medicine."

[18] Professor Jeffrey Pfeffer of the Graduate School of Business at Stanford University is one of several commentators who have emphasized the importance of "slack" to enable collaboration and collective efforts—including discussion, review and comment, professional development, and service to the "community of practice," as well as pursuing the scent of curiosity.

Chapter One: Making Sense of the US Intelligence Community

The Intelligence Community is an exemplar, even if not a healthy one, of a truly complex adaptive system.

A Complex Adaptive System

With its fifteen diverse agencies and its wide range of functional responsibilities, the Intelligence Community presents a very complicated set of organizational arrangements. Thinking of it in terms of traditional organizational analysis or systems engineering methods in an effort to explain its working does not suffice because it far more resembles a living ecology with a complex web of many interacting entities, dynamic relationships, non-linear feedback loops (often only partially recognized), and specific functional niches that reflect momentarily successful adaptations to the environment.[1] These complex interrelationships among its components create dynamic adaptations to changing conditions and pressures and make the Intelligence Community especially difficult to understand.[2] In fact, it is an exemplar, even if not a healthy one, of a truly complex adaptive system.

During the Cold War, proportionately more resources supporting a larger cadre of experienced analysts devoted to a simpler and relatively static priority target, as well as a broad array of established sources, disguised many of the Intelligence Community's dysfunctional aspects and growing internal problems. The community's loosely federated structure and complicated, if not Byzantine, processes had previously appeared tolerable, even if not fully successful, because making changes appeared to present a greater risk.[3] In the face of a drastically changed security environment, however, it is exactly the combination of complexity and opaqueness that has masked the increasingly dysfunctional misalignment of "dinosaur" analytic processes and methodologies from earlier recognition by both analysts and consumers of intelligence, much less by outsiders.[4]

Even for insiders, the workings of the Intelligence Community are difficult to understand because, as a rule, its members are not deeply self-reflective about its practices and processes. For outsiders, however, these difficulties are magnified by the community's compartmentation, security restrictions, and intrinsic opaqueness. That is why applying traditional organizational analysis that concentrates on structure is doomed to failure; understanding these complex adaptive systems requires more synthesis than traditional "reductionist" analysis.[5] In this case, moreover, it is a complex adaptive system that, insulated by security barriers, has managed to ignore and—probably because of its centralized direction, however imperfect—suppress important external signs of change and to amplify self-protective internal signals, which often reflect strongly ingrained cultural preferences.

The results of the Intelligence Community's failure to recognize the increasing dysfunction were both paradoxical and unfortunate. They were paradoxical because—although it has been accused of not adapting to dramatically changed conditions—the commu-

[1] A feedback loop, in systems analysis, is a relationship in which information about the response of the system to stimuli is used to modify the input signal (see "Feedback," *Principia Cybernetica Web*). A non-linear loop is one that creates non-proportional responses to stimuli.

[2] See Peter M. Senge, *The Fifth Discipline: The Art & Practice of the Learning Organization*. Senge is the founder of the Organizational Learning Laboratory at MIT.

[3] The pressures of the Manichean confrontation with the Soviet Union tempered enthusiasm for drastic and disruptive changes. These might have improved effectiveness, but they would also have provoked bureaucratic and congressional battles over power and jurisdiction.

[4] After all, the dinosaurs were superbly adapted to their environment; even if they perceived the signals of change, they became extinct because they could not adapt to unfamiliar environmental conditions.

[5] An appreciation of the distinction between a complicated system and one that is complex and adaptive is important for accurate diagnosis and effective solutions. A hallmark of complex adaptive systems is that they produce "emergent behavior," which cannot be prediced by analysis of their component elements or structure.

nity adapted all too well. And they were unfortunate because the pressures to which it did adapt flowed from misperceptions inside and outside the Intelligence Community engendered by the collapse of the Soviet Union: that there would be no significant challenges to American interests; that the end of the Cold War reduced the need for a "national security state"; that there should be a substantial "peace dividend," a large part of which would be paid by the Intelligence Community. The community's adaptive processes did accommodate these changes internally—especially the need to "survive" the huge budget cuts and to become relevant to the articulated needs of the paying customers.

It is important not only to locate the level at which obvious symptoms occur, but also the level at which problems can be solved.

However, these internal pressures outweighed the huge new challenges emerging in the external security environment. Responding to these would demand new expertise and a new knowledge base, along with appropriate methods, tools, and perspectives—all of which required more resources, focused leadership, and strong commitment, which was not there. As a result, the community fostered a series of processes that were increasingly maladapted to needs emerging in the new geostrategic environment. By responding to the wrong signals, it created Perrow's "error-inducing systems."[6]

Relating Structure and Process

Unfortunately, most Intelligence Community reform proposals concentrate on changes in structure and in directive and managerial authorities. Analytic problems, however, actually take place not just at the level of the community as a whole, but at four distinct levels, as well as in the complex interrelationships, both vertical and horizontal, among them.[7] Thus, it is important not only to locate the level at which the obvious symptoms appear, but also the level at which the problem can be solved. In this way, the root causes of failure can be identified and appropriate and effective corrective measures taken.

The National Security Community. The relevant entities include the National Security Council (NSC), the Office of the Director of National Intelligence (ODNI), and the national policymaking and operational elements in the Department of State and the Department of Defense.[8] Among the failures at this level can be misdirected priorities and misallocation of resources; poor communication and coordination; and inconsistent apportionment of authority, responsibility, and capability among the main entities. Such failures flow downward and can easily percolate throughout the subordinate organizations.

For the Intelligence Community, a particular problem at this level may involve its relationships with top-level users, especially managing their expectations. On the one hand, for example, the Intelligence Community often demonstrates an inability or unwillingness to say "no" to consumer requests, which leads to additional priority taskings without concomitant resources or relief from other ongoing activities. Similarly, the Intelligence Community often conveys an illusion of omniscience that fails to make clear its state of knowledge on an issue, the underly-

[6] See Perrow, *Normal Accidents.*
[7] The briefing on "Analytic Pathologies" graphically illustrates the multi-level interplay of these problems. See Appendix A for a summary.
[8] At this level, for the Intelligence Community, it is the ODNI and the Intelligence Community elements that are responsible for critical functions—collection, analysis, special activities, and community management—that interact directly with senior principals. With a DNI and an ODNI organization in place, these relationships are likely to become even more complicated.

ing quality of the intelligence, or the degree of uncertainty—all of which can leave the Intelligence Community seemingly responsible for decisions taken on the basis of "bad intelligence."

The Intelligence Community. This level currently includes the fifteen component intelligence agencies. Failures at this level can include misdirected priorities and budgetary allocations within the Intelligence Community; lack of effective procedures and oversight of them among component agencies; poor communication and coordination among agencies; a lack of enforceable quality-control processes; toleration of substandard performance by individual agencies; poor communitywide technical standards and infrastructure that hinder information sharing; and poor management and oversight of security procedures that impede effective performance. Errors at this level also encompass failures by groups or individuals to make critical decisions, to exercise appropriate authority, or to take responsibility for gross errors that should be worthy of sanction or dismissal.[9]

The Individual Analytic Units and Organizations. It is essential to appreciate the importance of particular analytic environments within specific sub-organizations—an office within the CIA's Directorate of Intelligence, for example. It is these entities, rather than the organization as a whole, that create the work processes and practices that form the immediate cultural matrix for an analyst's behavior.[10] Failures at this level can include dysfunctional organizational processes, practices, and cultures that inhibit effective analysis by individuals and sub-units; management attitudes and directives that stress parochial agency objectives; toleration of poor performance; excessive compartmentation and special security procedures that erect barriers to effective execution; poor prioritization and assignment of workflow; inability to create and protect "slack" and conceptual space for intellectual discovery; ineffective recruitment and training; maintaining stand-alone information and analysis infrastructures, including ineffective support for individual analysts; poor direction and management of the analytic process; and, simply, ineffective management of the analytic cadre. This is probably the most important level for creating consistently high-quality analysis because of its impact on the analytic environment, on the selection of methods and processes, and on the work life of individual analysts. Errors at this level are perhaps the most pernicious, however, and they have been widespread and persistent.

Individual Analysts. Failures at this level can include poor performance due to lack of ability, lack of domain knowledge, lack of process expertise, poor social network contacts, or ineffective training; pressures to favor product over knowledge; lack of time; being too busy and too focused to maintain peripheral vision and curiosity, even on high priority work; failure to cooperate and collaborate with others; lack of suitable tools and support; misguided incentives and rewards; and an organizational culture and work practices that tolerate second-rate analysis.

To illustrate the impact of this multi-level hierarchy and underscore the importance of correctly identifying the locations of causative factors in analytic errors, for example, consider the case of an analyst who fails to interpret correctly the evidence pertinent to

[9] See Statement by Admiral David Jeremiah (USN, ret.), Press Conference, CIA Headquarters, 2 Jun 1998, for a suggestion that failures by senior managers to make key decisions had been an important factor in the CIA's failure to warn of an impending Indian nuclear test. (The subject was the "Jeremiah Report" on the 1998 Indian nuclear test.)
[10] See Karl E. Weick, *Sensemaking in Organizations*.

a task and draws a wrong conclusion. At first glance, the obvious approach should be to focus corrective actions on the analyst: what caused the failure, and what are the appropriate remedies? Simple incompetence, a rush to complete the assignment, a lack of domain knowledge needed to recognize critical linkages, or a failure to employ appropriate methods could all be causative factors. At this level, the obvious remedies to these problems are better screening, training, and mentoring.

It could be, however, that the problem lies with the analytic unit, its work processes, and its management: the tasking was high priority, and this analyst, whose expertise is on another subject, was the only one available; appropriate tools and methods were not provided; training in relevant domain knowledge or on effective new tools had been postponed due to production pressures; or, given the production cycle, the analyst lacked sufficient time to search for all the relevant evidence. The problem could reside even farther up the hierarchy, among the agencies of the Intelligence Community: key data from another agency was not made available, due to compartmentation restrictions or because incompatible information infrastructures prevented the analyst from easily searching another agency's holdings. Finally, the failure could actually reside at the topmost level, with community management: this account was given such low priority that no collection resources had been assigned to gather information or to provide consistent analytic coverage or, because of the thinness of the evidence base, the inability to answer the question was not made clear to the requester at the start.

However, it is exactly here that the "5 Whys Approach" of the Quality Movement proves its value.[11] Applying this approach, which features a progressively deeper, recursive search, forces the investigator to trace a causative factor to its source.[12] Assume that, in this example, it is a lack of domain knowledge.

Why was an analyst not fully knowledgeable in the domain working that account?

She was covering for the lead analyst, who is away on temporary duty (TDY).

Why did the analytic manager assign that analyst to the task?

She was the only one available.

Why was the analyst not fully knowledgeable on her backup account?

She is an apprentice analyst with only a short time on the account and inadequate mentoring. Her training had been postponed due to scheduling. She didn't have time to be curious and follow the information scent. She could not access the lead analyst's "shoebox."[13]

Why couldn't she access the shoebox of the lead analyst?

[11] The Quality Movement took root in the United States during the 1990s, when US auto manufacturers were challenged by the emergence of higher quality Japanese automobiles made by automakers who had adopted the principles of two US engineers, W. Edwards Deming and Joseph Juran. The principles provide a systematic set of processes and metrics for improving the quality of manufacturing processes.

[12] A recursive search is one in which successive searches build on the results of earlier searches to refine the answers returned. (See National Institute of Standards and Technology, *Dictionary of Algorithms and Data Structures*.)

[13] Although seldom used today, many analysts once referred to the personal files where they stored such items as the results of research as "shoeboxes." It is used here to emphasize the particularity of the methods employed by analysts.

It is his personal collection of tentative hypotheses and uncorrelated data kept as a personal Word file and is not in an accessible database. The shoebox is actually a pile of paper put in temporary storage when the lead analyst went on TDY.

Why is the lead analyst unwilling to share his shoebox?

Why is there no accessible collaborative system for sharing shoeboxes?

The questions would continue through as many rounds as the questioner needed to satisfy himself that he had found the root cause.

Although the previously cited reports on intelligence failures usually point to organizational stove-piping and technical shortcomings as the most important contributors to failures in collaboration, the sources of such failure are actually more widespread and complex—and more frequently reflect shortcomings in work practices and processes, organizational culture, and social networks.[14] In addition, the proposed solutions that focus on structures and authorities disregard the critical interrelationship between structure and processes and ignore as well the importance of organizational culture on institutional effectiveness. As Stephen Marrin, among others, has noted:

Structure and process must work together in a complementary fashion, and structural changes alone without corresponding changes to existing processes would simplify the workings of the Intelligence Community in some ways, but cause greater complexity in others.[15]

The significant structural reforms legislated in 2004 will also entail substantial short-term transition costs to effectiveness as new organizational arrangements are implemented, processes are developed, and outmoded roles and systems are replaced. The really difficult task will be to redesign the processes, so that they are consistent and complementary to the structural changes that are being made.

Incorrect diagnoses of the causes of analytic failures probably arise from not recognizing the variety and complexity of the roles, missions, and tasks that confront analysts.

The Analysis Phase-Space

At a basic level, incorrect diagnoses of the causes of analytic failures probably arise from not recognizing the variety and complexity of the roles, missions, and tasks that confront analysts. This diversity results in a complex phase-space, illustrated below, that contains a significant number of discrete analytic regions. These certainly cannot be treated as though their perspectives and needs were homogeneous or even similar. The tasks required of a signals intelligence analyst attempting to locate a terrorist's cell-phone call are fundamentally different from those of an all-source analyst drafting an NIE on Chinese strategic nuclear doctrine. Therefore, because intelligence collection and analysis are not based either on a suite of all-purpose tools or on fungible human expertise that can be instantly swiveled to focus effectively on a different set of problems, this phase-space also implies the need for a similar diversity of analytic processes, methods, knowledge bases, and expertise.

[14] Technical systems and infrastructures enabling collaboration are important, but they are only a small part of the solution to fostering effective collaboration. For more on this topic, see discussion beginning on page 57.

A phase-space is a conceptual tool used by physicists to represent the abstract set of all potential dynamic values of a system that can be produced by every combination of system variables possible in each dimension. The relatively simple, 3-valued phase-space for analysis shown above includes dimensions for different domains and accounts, types of products and services, and sources of intelligence.

Differentiating Intelligence Roles

Moreover, given this diverse phase-space, conflating three distinct roles played by all-source intelligence adds to the underlying confusion over intelligence missions and functions, the priorities among them, their requirements, and the capabilities needed to make each effective. The traditional assumption that there were only two sets of intelligence consumers, each with distinct mission needs, often led to contraposing support to military operations, which was assumed to be tactical in focus, and national user support, which was assumed to demand deep analysis. In reality, meeting the disparate needs of the users intelligence must serve requires recognizing three distinct roles for all-source intelligence.[16] Two of them, Support to Military Operations (SMO) and Support to Policy Operations (SPO), focus primarily on issues needing immediate information capabilities to assist decisionmaking on current operations. Although SMO and SPO issues are of interest to both national and departmental users, the third role, Warning and Estimative Intelligence (WEI), largely emphasizes issues that are almost exclusively the province of national users and usually take place over longer time horizons.[17]

In all cases, however, although it still uses the term "support," the Intelligence Community must move beyond the notion that it is segregated from the rest of the national security community and that it merely provides apolitical information to decisionmakers. Intelligence has now become an integral element of both the policy and military operational processes; and the success or failure of its judgments can have the most significant consequences in both domains.[18] Increasingly-integrated military operations, in which intelligence directly drives operations, and command centers in which intelligence personnel are fully integrated, are tangible evidence of such changes. As a result, it is important that intelligence appreciate not only the central-

[16] It is important to recognize that these regions have fuzzy boundaries, overlap to some degree, and are not totally distinct.

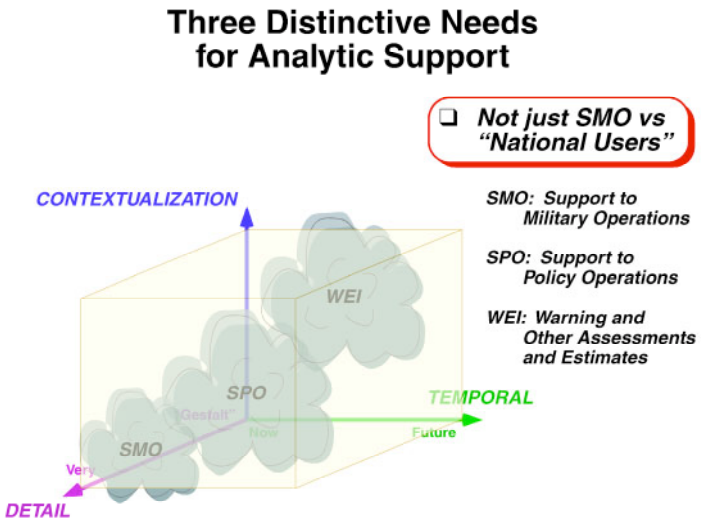
[17] The intelligence role that often leads to confusion over appropriate categorization is warning, and especially the tactical warning component. Because warning is intimately connected to a decision on a responsive action, it is sometime mistakenly considered to be a decision-support activity; in reality, it is more appropriately seen as a part of the informative function that assists policymakers in thinking about issues before they occur, helping to create coherent, contextualized reference frames. Moreover, because tactical warning is *tactical*, it is often forgotten that it is of principal concern to high-level strategic users because it almost always involves activities that could have the most serious political and strategic consequences. Thus, these three roles cover two distinct functions: SMO and SPO emphasize situational awareness and immediate decision support, while WEI focuses on anticipation of future circumstances.

ity of its role, but also the increased obligations and responsibilities that such a role brings.[19]

Support to Military Operations (SMO): This traditional intelligence role has usually focused on assisting current military operations. Much of this information concerns current numbers, locations, and activities of hostile units, and other information addresses significant elements of the physical environment in which military forces are operating.[20] Other military users need quite specific current data on subtle technical characteristics of adversarial equipment and forces to serve, for example, as targeting signatures or to support electronic warfare (EW) activities. Regardless of type, intelligence supporting operating forces demands extraordinary accuracy, precision, and timeliness to ensure that it is immediately "actionable" under conditions that are highly stressful and potentially lethal.[21]

Increasingly, however, military operators have other operational intelligence needs, such as support for information operations and for security and stabilization in Iraq. To prosecute these missions successfully, the military now also needs far more cultural awareness and timely accurate information on adversary thinking, motivations, and intentions.

Support to Policy Operations (SPO): Making explicit that this is a distinct role emphasizes the importance of intelligence to daily policymaking across the entire spectrum of national security concerns; it is the



Graphic courtesy of SAIC

"national user" cognate of SMO. SPO provides policymakers and senior officials (importantly including senior civilian defense officials, combatant commanders, and other military officers) with indispensable situational awareness, including important background information, to assist them in executing and overseeing ongoing policy activities and in planning and framing policy initiatives. As it is as intensely focused on providing actionable information, it is as heavily oriented as SMO to current intelligence and reporting. However, SPO differs from SMO somewhat in content and priorities in that it has always included a greater proportion of less quantifiable, softer information, such as political and economic

[18] I am grateful to Dr. Russell Swenson of the Joint Military Intelligence College for persuading me to sharpen this point. See Russell G. Swenson, with Susana C. Lemozy, "Politicization and Persuasion: Balancing Evolution and Devolution in Strategic Intelligence," unpublished manuscript. When the CIA was created, expectations about intelligence capabilities and its role were significantly different than they are today. At the policy level as well, there is now an expectation that intelligence will be available to guide policy creation and inform course changes if necessary.
[19] A valuable guide to appropriate comportment in these circumstances is Herbert Goldhamer's *The Adviser.*
[20] The US Army, which has extensive doctrine on operations, calls this intelligence preparation of the battlefield (IPB). This includes specific information on mission, enemy, time, terrain, and troops available (METT-T).
[21] A critical example is the need for technical details, so that enemy weapons, such as improvised explosive devices (IEDs), can be countered.

trends in major countries and groups and assessments of foreign leaders and their intentions.

Warning and Estimative Intelligence (WEI): Mary McCarthy, a former National Intelligence Officer (NIO) for Warning, commented on the recommendations of a DCI-chartered study conducted in 1992:

> *According to that ten-member panel of highly respected intelligence and policy veterans, providing policymakers with persuasive and timely intelligence warning is the most important service the Intelligence Community can perform for the security of the United States.*[22]

A warning process . . . allows decisionmakers to think through responses they might be obliged to make in haste.

McCarthy defines warning as "a process of communicating judgments about threats to US security or policy interests to decisionmakers."[23] Thus, warning provides vital support to "national users" in their principal *strategic* missions—understanding the complex geostrategic environment, fostering vision of objectives, assessing alternatives and determining strategy, and protecting against consequential surprise; most importantly, when done properly, warning is forward looking and anticipatory.[24]

Warning is sometimes thought to be merely alerting decisionmakers to immediately threatening activities, but, in reality, it is a far more complex function and actually addresses two very different kinds of problems. One type of warning is concerned with monitoring activities previously recognized as potentially dangerous, such as a hostile missile launch, and cueing appropriate responses. The second type is a discovery function that assists decisionmakers in identifying those situations and activities whose consequences could have significant (and usually adverse) effects—and which may not necessarily be obvious. When performed effectively, a warning process provides decisionmakers with an anticipatory sensitization that allows them to think through, in a disciplined way, the responses they might someday be obliged to make in haste. Assessments and estimates, on the other hand, also are usually forward looking, but they are designed to be informative rather than part of a process closely tied to triggering contingent responses.

Further complicating the matter is that both types of warning also operate over three different horizons. *Strategic* warning has always been understood as looking out toward the distant future; it is intended to recognize that a possible threat may be looming—even if it is not imminent—and to provide time to take appropriate preparatory actions, including policies and actions that might prevent the threat from eventuating.[25] *Operational* warning also looks out in order to identify the characteristics of the threat (the likely and particular methods of attack), so that offsetting contingency plans and actions can be prepared. From this detailed understanding of enemy intentions, capabilities, and concepts, operational warning also serves to identify indicators that an

[22] Mary McCarthy, "The National Warning System: Striving for an Elusive Goal," *Defense Intelligence Journal* 3 (1994): 5. Warning is considered the classic "strategic intelligence" role and was the principal reason for the creation of the CIA.
[23] Ibid.
[24] There have always been terminological problems associated with the word "strategic." During the Cold War, users of the word often conflated level of analysis (global and synoptic), time horizon (forward-looking), and magnitude of the stakes (very large), with instrumentality (nuclear) and distance (intercontinental).
[25] To some degree, these terms have always been confusing because they described two very different types of problems. Strategic, operational, and tactical warning related to surprise nuclear attack were very patterned, but focused on two distinct problems: surprise attack executed by known forces and surprises that were truly unanticipated.

attack is in preparation. Finally, *tactical* warning is the immediate alerting function that a specific (with respect to time, place, or character) hostile activity has begun or is about to begin.

An important but often overlooked element of warning over all three horizons is the key role played by negative evidence, which can help confirm that potentially threatening activities are **not** occurring and prevent costly and potentially consequential responses from being taken or scarce resources from being squandered.[26] During the confrontation between the United States and the Soviet Union, and, in particular, during periods of high tension between them, one of the most important functions of warning was to inform the leaders that, "Today is not the day."

Both the warning and estimative functions are designed to focus more on informing decisionmaking with context and long-term implications than with supporting ongoing activities. The preparation of assessments and estimates, as well as development of warning indicators, has more to do with analysis and judgment than with reporting; it demands deep expertise as well as an ability to place knowledge of the subject in broad context. These important functions serve the entire national security community.[27]

Although warning is often misconstrued as a current intelligence problem, even tactical warning of specific targets, times, and means must build on this deeper foundation of pre-emptive analysis of threats and responses if it is to be effective. During the Cold War, recognizing that we were engaged in a long-term competition, we were prepared to adjust our intelligence priorities so that analysts could provide assessments of future capabilities and indications of intentions, even though the day-to-day threats were most grave. As was the case in facing the Soviet Union, there may well be tensions today in choosing between serving SMO and SPO, on the one hand, and assuring adequate resources for WEI, on the other hand, as continued access to information needed for an understanding of enemy intentions and capabilities could be sacrificed by meeting the needs for immediately actionable intelligence.

Although warning and estimative intelligence may be seen as the core missions of strategic intelligence, they are also less tied to the details of ongoing operations in which the formal relationships between policymakers and intelligence provide a unique advantage and leverage for intelligence insights. Today's decisionmakers have many more sources of information than did their predecessors when the Intelligence Community was created; in turn, the Intelligence Community holds far less of a monopoly over information about foreign events and technology developments. Moreover, as one senior intelligence official noted, policymakers see themselves and their staffs as substantively knowledgeable on issues of interest as the Intelligence Community and capable of serving as their own intelligence analysts.[28] As a result, users increasingly

Today's decisionmakers have many more sources of information than did their predecessors. . . ; in turn, the Intelligence Community holds far less of a monopoly over information about foreign events and technology developments.

[26] Perhaps the scarcest resource is a senior decisionmaker's attention, which can easily be wasted.
[27] As an indication of the long time horizon involved in this function, both civilian and military defense officials need to look well into the future to develop strategy, plan forces, support research and development, and acquire systems.
[28] See Charles E. Allen, "Intelligence: Cult, Craft, or Business?" in "Comments of the Associate Director of Central Intelligence for Collection" at a Public Seminar on Intelligence at Harvard University, spring 2000. See http://pirp.harvard.edu/pdf-blurb.asp?id+518: 15. Henry Kissinger may be the most obvious example of this tendency, but it has continued since the Nixon administration and has come to include a far greater proportion of policy officials, especially as the sources of information on foreign developments have expanded dramatically and become available in near real-time. See Henry A. Kissinger, "America's Assignment," *Newsweek*, November 8, 2004: 38–43.

see themselves as participants in a process of judgments.[29] An experienced national-level user wrote recently,

> *Today, the analyst no longer sets the pace of the information flow. The sources of information now available to the policy-level consumer…are far, far greater than a quarter century ago. It is almost a given that today's policy-level consumer of intelligence is well informed in his or her area of interest and not dependent on an intelligence analyst for a continuing stream of routine, updating information.*[30]

Implications of Differentiating Roles

Careful differentiation among the three intelligence roles discloses dimensions that are both analytically important and more meaningful for contemplating intelligence reform than the usually misleading bimodal distinctions between national vs. military users or tactical vs. strategic objectives. What truly distinguishes these intelligence roles is their *perspective and emphasis*—a significant distinction that has been lost in recent arguments over intelligence reform.

To begin with a particularly important point, a tactical or a strategic focus does not necessarily distinguish military from civilian users.[31] Moreover, the less quantifiable and, therefore, *softer* information and analysis on individuals, decisionmaking, and social dynamics that used to be produced primarily for national users is now increasingly demanded to support military operations at the tactical level. Such information is inherently more judgmental and inferential—and, therefore, less precise—than analysis of physical or technical characteristics in orders-of-battle (OOBs) and tables of organization and equipment (TOEs). It is less amenable to counting or to the gathering of external physical signatures by technical collection systems; it is more dependent on language skills, deep expertise on the region and cultures, and knowledge of the personalities.[32] It is also harder to validate or prove than estimates of technical factors. Such capabilities go beyond "reporting" that used to be the core of current intelligence.

However, both SMO and SPO are, by nature, mission- or task-oriented and tightly focused on the problem at hand; and this narrowed focus has significant time and perceptual implications for analysts and the intelligence sources supporting them.[33] Given the stress, time pressures, and immediate—as opposed to potential—stakes attendant on current operations, human decisionmakers try to concentrate only on the immediate situation and the information relevant to it, while actively screening out other inputs. This is the intelligence analogue of human "foveal vision," which offers the highest visual resolution but also a very narrow field-of-view.[34]

[29] As one senior intelligence official remarked in a private meeting, "We are all in the business of making judgments; but too many in the Intelligence Community continue to believe that they are instead providing crystalline analyses."
[30] Clift, "Intelligence in the Internet Era," *Studies in Intelligence* 47, no. 3 (2003).
[31] This distinction might have been clearer before civilian leaders began taking detailed interest in overseeing tactical operations—as began during the Vietnam War with presidential interest in the selection of bombing targets. With respect to the Soviet Union during the Cold War, national and military users had clear areas of primary interest; national users were focused on intelligence illuminating key political, economic, technological, and social factors affecting national power and intentions, while military users were more focused on the likely force capabilities and doctrines of potential adversaries. After the Cold War, improving technical capabilities and the emergence of the "strategic corporal" combined to increase the interest of civilian policymakers in overseeing tactical operations.
[32] Several senior military participants at the Charlottesville conference highlighted these demands. See *Charlottesville Conference Report*, 2–5.
[33] There is a very large body of literature on the physical and psycho-perceptual effects on human judgment and decisionmaking under stress that is relevant to these distinctions.

In contrast, warning and estimative intelligence are the analogues of human "peripheral vision," in which there is low resolution but a wide field-of-view. Peripheral vision is very sensitive to cues of dynamic change, which trigger anticipatory responses. Although warning is concerned with activating the response cycle, and estimative intelligence is intended to create a frame of reference for the decisionmaker, both are intended, through preconditioning and anticipatory consideration, to enable a more appropriately and contextually sensitized response on the part of users.[35]

Another important implication of the differing emphasis on decisions with a long-term view and those requiring prompt action—the classic distinction between strategic and tactical—concerns the nature of the advantage to be gained from the information, and, therefore, how it is exploited. In recent years, the tasks of intelligence, and its successes and failures, have focused on providing immediately actionable (in this sense, tactical) intelligence to users—information that can provide a rapid or near-instantaneous advantage, whether for interdicting hostile military forces, preventing terrorist incidents, or supporting diplomatic initiatives. Emphasizing current intelligence for actionable exploitation may have created an unintended mind-set that undervalues the immense importance of knowing and understanding the adversary's intentions throughout the course of the confrontation, even at the cost of foregoing exploitation of these sources for temporary advantage on the battlefield or in the diplomatic conference room.[36] This stress on current intelligence also influences the priorities among the types and attributes of information we collect, the nature of the collection and processing systems, the analytical methods we use, the stresses we place on analysts, and the metrics by which we assess the performance of intelligence.[37]

There is yet another important distinction between these roles. By looking out to the future, WEI is basically a surprise-preventing function intended to heighten a policymaker's ability to visualize the consequences of anticipated and unanticipated events and to prepare for them mentally; it is not designed to be "evidence-based truth-telling" that will stand up in court. In addition, as we better appreciate the implications of emergence and the emergent behaviors of complex adaptive systems, we need to place greater emphasis on anticipation while recognizing that precise prediction or forecasting is even harder than previously understood. Appreciating the differences in perspective created by these roles is very important because failing to make clear distinctions between them may aggravate a major problem before the Intelligence Community: the disconnect between the emphasis on current reporting or providing situational awareness, which must be evidence-based, and

[34] The fovea, a small pit at the back of the retina, forms the point of sharpest vision. The intensely narrow concentration of foveal vision is recognized as being a major contributor to "change blindness."
[35] One type of warning function amenable to focused monitoring involves potential surprise from a recognized adversary undertaking a feared but pre-identified activity (such as a Warsaw Pact invasion across the Inner-German border). This other warning function serves to guard against truly unexpected or unforeseen events. In both cases, they are designed to encourage thinking about, and contingency planning for, "surprises" before they occur.
[36] The widely repeated—but apocryphal—story that perhaps best exemplifies this understanding of "strategic intelligence" is that of Churchill's allowing Coventry to be bombed in order to safeguard the long-term informational advantages gained from Allied code-breaking achievements against the Axis. The immeasurable importance of such intelligence in the successful Allied efforts to interdict Rommel's supply lines during the North African campaign and in winning the crucial Battle of the Atlantic testify to these other equities with possibly higher priority.
[37] Barger, 26. Although her specific comment refers to the impact of precision (timeliness and resolution, for example) on the quality and quantity of intelligence, her larger point is that functional needs stemming from roles and missions drive what the Intelligence Community provides its users and how it does so.

When one tries to assess the adequacy of Intelligence Community performance … or prescribe changes … the appropriate answers will almost certainly differ greatly from one role to the other.

the policymaker's need for anticipatory judgments, which, by nature, trade the confidence derived from hard evidence for an intuitive, or *gestalt,* understanding of the whole derived from inference.[38] It is unlikely that analysts will have firm evidence to offer the policymaker to support alternative interpretations of the future, and they will need to rely on inference and informed speculation that is persuasive to decisionmakers.[39] In particular, as one experienced intelligence analyst noted,

> *"Getting inside the other guy's head" can only be conjectural because, in most cases, even the "other guy" doesn't know exactly why he's doing what he's doing.*[40]

Even if there are predictive judgments to be made in both SMO and SPO,[41] they tend to have short time horizons and reasonably short inferential chains; as the predictive time-constants are short, observation of adversary actions can serve to validate or disprove these judgments and thereby improve confidence in them and the analyst's judgment.

Those providing SPO, in particular, must continually walk a fine line between serving the policymakers' needs for relevant, focused, direct support and maintaining objectivity in providing the evidence and analysis. Staying close to the evidence assists the analyst in walking this line. At the same time, the author of this monograph noted a clear consensus among senior intelligence officers at a recent non-attribution conference that analysts can best serve policymakers by offering them thoughtful and thought-provoking views that challenge their assumptions. It must be recognized, however, that helping to alter policymakers' assumptions is intruding directly into the policymaking process and, thereby, crossing the boundary that Sherman Kent tried to establish. As the policymakers demand judgments on actions and consequences farther in the future (moving the intelligence role from SPO to WEI), not only will the intrinsic uncertainties increase, but also the potential for tensions between policymaker and analyst over the objectivity (and validity) of the judgments and the conflicts among differing judgments.[42]

Another of these distinctions affects intelligence requirements and planning. Unlike SMO and SPO, where the users can clearly identify their areas of interest, priority issues, and information needs, the Intelligence Community must look beyond its users' perceptual horizons if it is to perform warning and estimative functions effectively. Almost by definition, with anticipatory intelligence, policymakers will be unable to tell the community where to look. Unfortunately, although the Intelligence Community must recognize that attempting to divine requirements for warning and other anticipatory intelligence from the users is not likely to be fruitful, it also must appreciate that it alone will bear the blame for failing to warn against the inevitable surprises arising from outside the fields-of-view of users. This demands, in turn, that the Intelligence Community have some discretion and flexibility to allocate resources in areas not currently considered to be priority targets: listening

[38] *Gestalt*, a German word meaning "form" or "shape" is used in psychology to connote holistic understanding of the entirety of a phenomenon. This follows Kendall's approach of "creating pictures," as noted by Jack Davis in "The Kent-Kendall Debate of 1949," *Studies in Intelligence* 35, no. 2 (1991).
[39] This is a comment to the author by a senior intelligence officer who has served in both roles.
[40] Private communication to the author from John Bodnar, 3 November 2004.
[41] The military, in particular, is increasingly emphasizing "predictive battlespace intelligence" as a central component of "information superiority." It is usually, however, a different kind of prediction than that required to support SPO.
[42] As the founder of Air Force and Joint Staff Studies and Analyses, Lt. Gen. Glenn Kent (USAF, ret.), paraphrasing Shakespeare, once warned analysts, "Neither a prostitute nor a proselytizer be."

too closely to the customers, and looking only where directed, guarantees future strategic warning failures.

It is absolutely essential that the Intelligence Community and those who depend on it understand the principal distinctions between these two functions. In their conclusions about the nature of the Intelligence Community's problems, the extraordinary differences between the report of the 9/11 Commission and that of the SSCI on Iraqi WMD reveal the dangers of conflating the two distinct functions or ignoring the differences between the three roles. When one tries to assess the adequacy of Intelligence Community performance across these domains, identify shortfalls, or prescribe changes—whether in business practices, tools, or organizational arrangements—the appropriate answers will almost certainly differ greatly from one role to the other.

Chapter Two: Assessing Critical Analytical Shortfalls

Many of today's principal analytic problems arise from continued reliance on analytic tools, methodologies, and processes that were appropriate to … the Cold War.

As astute members of the Intelligence Community have observed, intelligence capabilities (and the organizations that provide them) are not general purpose tools but, rather, specialized and "finely honed" instruments that evolve and adapt to the specific challenges and requirements placed upon them.[1] Many of today's principal analytic problems arise from continued reliance on analytic tools, methodologies, and processes that were appropriate to the static and hierarchical nature of the Soviet threat during the Cold War and were, in that environment, largely successful. We possessed several decided advantages that enabled us to overcome some of the limitations on our capabilities: a careful and cautious "Main Enemy" that was also a far simpler and slower target than those we face today; more time; many and more experienced analysts; and varied and well-established sources of information, including the adversary's own vast outpouring of seemingly trivial but very useful data.

Given these advantages, the Intelligence Community was able to:

- Concentrate, focus, and build a deep foundation of cumulative evidence;
- Foster longstanding and deep expertise in its analytic cadre by exploiting a very dense information environment;
- Rely on multiple-source collection, which generally allowed us to cross-check information and make judgments consistent with the highest professional standards;
- Largely neglect intelligence collection and analysis on "soft" cultural, societal, and people issues (other than the most prominent elites), because the plans and intent of the adversary were in the hands of a small Politburo and because we "knew" that knowledge of the plans and intent of subordinate elements or nations—for example, Poland—was rarely necessary;[2] and
- Employ an intelligence model that could rely on collecting "secrets" in voluminous quantities and required a mass production approach for producing reports.[3]

That was also a period of relative information scarcity on worldwide events, and the Intelligence Community had a substantial comparative advantage over other information providers through access to intelligence obtained by clandestine collection.

The United States had many Cold War successes, of course, but there were always significant shortcomings in American intelligence capabilities. These shortcomings resulted in surprises that had important and unanticipated consequences for US policy. Among these were the Egyptian/Syrian attacks on Israel opening the 1973 Yom Kippur War, the 1974 Indian nuclear test, the fall of the Shah and the accompanying ascendance of a fundamentalist Islamic regime in Iran in 1979, the unexpectedly rapid collapse of the Warsaw Pact in 1989, and the dissolution of the Soviet Union in 1991.

The traditional intelligence methods were even less successful against some important targets that have carried over into the

[1] See Aris A. Pappas and James M. Simon Jr., "The Intelligence Community: 2001–2015," *Studies in Intelligence* 46, no. 1: 39–47; Bruce Berkowitz, "Intelligence for the Homeland," *SAIS Review* 24, no. 1 (Winter-Spring 2004): 3.
[2] To appreciate the costs of this view, see the brief account on page 41 of Professor Murray Feshbach's use of Soviet and Russian health statistics to derive an important conclusion.
[3] The bureaucratized nature of the Soviet Union and the state of telecommunications throughout the Cold War allowed the United States to exploit its technological prowess and employ effective remote collection capabilities in addition to the traditional method of using human sources.

post-Cold War era—such as Iran, China, North Korea, nuclear proliferation, and the global WMD black-market. In these cases (exemplified by the 1998 Indian and Pakistani nuclear tests), we have had serious shortcomings in understanding because, in the face of the numerous, continuing, and competing demands for higher priority current intelligence, we were unwilling or unable to make the long-term commitments to build the deep knowledge base the task required.

Today, the United States may need to take action more frequently on the basis of ambiguous intelligence, against harder to recognize threats, from less risk-averse enemies—especially the shifting groups of radical Islamic fundamentalists who foment terrorist activities and may wield capabilities that could devastate cities, societies, or economies. These new Islamic adversaries also pose, as did the Soviet Union, a long-term ideological challenge whose character and "operational code" we do not currently understand. Unlike the Soviet Union, however, which was a hierarchical, bureaucratic state whose organizational character we did understand, the new targets are more dynamic and complex. These new groups morph frequently and metastasize like cancers, emerging with new personalities and network linkages and threatening new targets.[4]

As a result, today's Intelligence Community must contend with:

- Little foundational knowledge on major adversaries and cultures;
- Fragmentary evidence and sparse intelligence flows, which often cannot be substantiated or contextualized—even against the highest priority current targets;
- Thin domain ("account") expertise, due to multiple and shifting priorities and frequent shuffling of relatively inexperienced analysts;[5] and
- An analysis model that remains heavily dependent on "secrets," even when the key intelligence questions may involve mostly "mysteries" and "obscurities."[6]

Aggravating these existing shortcomings, a cascade of significant and complex developments that will pose substantial new challenges is already evident, making the adequacy of the community's current capabilities even more problematic.[7] These changes involve more dynamic geostrategic conditions, more numerous areas and issues of concern, smaller and more agile adversaries, more focus on their intentions and plans and less on large physical objects and weapons systems, a more open information environment, and more widespread understanding of American intelligence methods and capabilities by our adversaries. Additionally, the sense of vulnerability to terrorist attack on US territory left by 9/11 has created huge new demands on the Intelligence Community to provide information for homeland security.[8] The immensity of these challenges complicates the task of developing appropriate cures for the real causes of inherited shortcomings and of heading off new analytic shortcomings.

[4] Marc Sageman, "Understanding Terror Networks," FPRI E-Note, 1 November 2004.
[5] In addition, inexperienced analysts may lack the ability to tap sources of deep expertise available through connections to long-standing professional networks.
[6] Fritz Ermarth originally developed this typology. For the details, see page 40.
[7] Barger, 28.
[8] At the same time, the breaching of old distinctions between foreign and domestic intelligence activities has increased public concern over potential threats to privacy.

The lengthy reports of the 9/11 Commission and the SSCI report on Iraqi WMD laid out in great detail their views on why these two failures occurred. Although they occurred in very different substantive domains, at very different levels of analysis, in different parts of the intelligence organizations, and exhibited significantly different failure modes and causative reasons, both reports tended to locate the causes in problems related to information sharing and coordination, instances of insufficient collection and poor data, and "errors" of analytic judgment by individuals and groups.[9]

The Intelligence Community now finds itself under intense scrutiny and faced with the need to transform in fundamental ways in order to meet the entire range of national security intelligence challenges only partially recognized in the legislatively mandated reforms. Addressing these challenges requires fundamentally new approaches in both collection and analysis as well as in the processing and dissemination methods that support them. As Barger aptly notes: what is needed is revolution, not reform.[10]

Misunderstanding Analytic Processes

The litany of failures should have been a tip-off to the deep-seated nature of the analytic problems. Such a series of "idiosyncratic" errors by individuals and small groups within an organization are, however, more likely to be symptoms than root causes, as Perrow convincingly demonstrated in case studies of Three Mile Island and Chernobyl.[11] A pattern of repeated errors is often a signal of seriously dysfunctional methods—fundamental and systematic failures of procedures and processes throughout an organization.[12] From this perspective, the proximate causes of the failures identified in both the report of the 9/11 Commission and the SSCI report on Iraqi WMD hardly appear to be convincing root causes of these recent intelligence failures.

A more accurate diagnosis of the sources of our intelligence shortcomings requires a deeper and more thoughtful analysis of why organizations make mistakes—causes that go beyond obvious superficial conditions created by flawed organizational structures and insufficient directive authorities. As Charles Sabel noted, "There he [Herbert Simon in *Administrative Behavior*] showed that modern organizations were efficient precisely because they systematically turned habits—the disposition to react to particular situations in a characteristic, but open-ended way—into rigid routines."[13] Not unexpectedly, these routines "work" for the specific conditions they were developed to address. They rarely perform well for off-design conditions, however, and, often, the better they work for the design conditions, the more narrow the set of conditions for which they are appropriate. Paradoxically, the better they work, and, therefore, the more efficient the organization at its routine tasks, the greater the danger that the organization will fail to be sensitive to its environment and changes occurring there. As with the dinosaurs, scores of major American corporations have fallen victim to this pat-

Major American corporations have fallen victim to a pattern of "overadaptation" and "change blindness." The Intelligence Community runs the same risk.

[9] Indeed, the IRTPA was largely driven by the recommendations of the 9/11 Commission, which focused mostly on one, albeit important, aspect of intelligence needs, that of counterterrorism. But, as noted above, the IRTPA reforms mandate changes that affect all functions of the Intelligence Community.
[10] Barger, 28.
[11] Perrow, *Normal Accidents.*
[12] For examples of the consistent nature of such errors, see the following: the "Jeremiah Report"; Interview with Richard Kerr, MSNBC, 14 July, 2003 (concerning the "Kerr Report" on the Iraqi WMD NIE). An unclassified portion of that report is in *Studies in Intelligence* 49, no. 3 (2005) (hereinafter cited as Kerr, et al.).
[13] Charles F. Sabel, "Theory of a Real Time Revolution."

tern of "over adaptation" and "change blindness."[14] The Intelligence Community runs the same risk.

The Problem of the Wrong Puzzle

Frequent public references to "failing to connect the dots" are especially problematic for an accurate understanding of intelligence errors and failures. This view of the analytic shortfalls is particularly perverse, because it masks the true nature of the analyst's challenges. The flawed "connect the dots" analogy flows from the image of the children's game book in which lines are to be drawn between a set of numbered dots in order to make a recognizable picture. That analogy assumes, however, that—as in the children's book—the dots exist, that it will be obvious which dots connect to which others and in what order.[15] The problem is that this simple analogy overlooks a well-known phenomenon in psychology that is often illustrated by the "Rubin Vase Illusion": that evidence really does not "speak for itself"; rather, that information is "perceived and interpreted."[16] Humans are extremely good at finding patterns, even when there is none—hence the classic intelligence aphorism, "You rarely find what you're not looking for and usually do find what you are looking for."[17]

Talk of a "science of analysis" is a conceit . . . . The reality is otherwise.

If we are to use a puzzle analogy, perhaps a more appropriate model might be that of a guest at a resort hotel who, on a rainy afternoon, wanders into the game room and finds a box holding a large number of jigsaw puzzle pieces. As the cover of the box is missing, there is no picture to guide him in reconstructing the puzzle, nor is there any assurance that all the pieces are there. Indeed, when he discovers that there are several other empty puzzle boxes on a shelf, it is not even clear that all the pieces in the box belong to the same puzzle. Reconstructing the puzzle in this example is a far different and more difficult challenge than linking numbered dots, where the outline of the image is reasonably apparent.[18]

Both the dots analogy and the model of evidence-based analysis (discussed in the following section) understate significantly the need for imagination and curiosity on the part of the analyst.

The Myth of "Scientific Methodology"

Many well-informed outside commentators and intelligence professionals continue to talk about the "science of analysis," and only some of them are truly aware of the shaky foundations of this belief or of its real implications.[19] But this talk of a "science of analysis" is a conceit, partly engendered by Sherman Kent's dominating view of intelligence analysis as a counterpart of the scientific method.[20] The reality is otherwise; analysis falls far short of being a "scientific method" in the common, but usually misunderstood, sense. Moreover, this view of science itself is "scientism," which fails to recognize the important role of less "ratio-

[14] See Carol Loomis, "Dinosaurs?" *Fortune*, 3 May 1993: 36*ff.* An accompanying sidebar recounted how a senior Sears executive pointed behind himself to the tens of volumes of corporate practices and rules that governed the corporate response to any conceivable problem. The emergence of mid-market national discount chains wasn't covered; and, therefore, "…wasn't a problem they had to address."
[15] This relatively simple problem is known formally in mathematics as a "directed graph."
[16] Edgar Rubin, 1915. Heuer discusses such perceptual problems using different examples in Chapter 2 of *The Psychology of Intelligence Analysis*.
[17] This remark is often attributed to Amrom Katz, a pioneer in aerial and overhead reconnaissance.
[18] Heuer, Chapter 6.
[19] See, for example, Frank Hughes and David Schum, *Evidence Marshalling and Argument Construction*.
[20] Sherman Kent, *Strategic Intelligence.* See also Jack Davis, "The Kent-Kendall Debate."

nal" and less "scientific" elements, such as imagination and intuition.[21] As Mark and Barbara Stefik, knowledgeable and respected participants in the discipline of science, have written about science and innovation in a recent book.

> *The word "theory" usually connotes a formal way of thinking logically or mathematically. In this formal sense, theory takes its place in a knowledge-generating process called the scientific method. The scientific method includes hypothesis formation, experiment planning, execution, and data analysis. In this scheme, theory is used to make predictions. Theory is created by a process that includes hypothesis formation and testing.*
>
> *Unfortunately, this notion of theory and the working methods of science and invention leaves out imagination. This makes it both boring and misleading….[22]*

Citing a well-known commentary by a Nobel laureate, the Stefiks add:

> *In [Peter] Medawar's view, the standard scientific paper promotes an error of understanding how science is done because it confuses proving with discovering.[23] The layout of a scientific paper makes it appear that the doing of science is the careful laying out of facts. Once the facts are in, the conclusions follow. This makes it seem like science is all about deduction. Unfortunately, this formal structure leaves out the creative part of discovery and invention. The structure of a scientific paper is only about proof, promoting the systematic marshalling of evidence. In this abbreviated story, once a scientist has by some means figured it out, the paper lays out the conclusions logically.[24]*

A more realistic and useful appraisal of the process of intelligence analysis comes from Charles Allen, a long-time senior intelligence official: "I want to speak mainly about the art and craft of intelligence…. We could have talked about the science of intelligence, but, by and large, as far as I'm concerned, the science of intelligence is yet to be invented. I don't see it. It's not really there."[25] This is not to suggest that rigor, accuracy, clarity, and precision are not required in intelligence analysis; given the stakes, they are obviously essential. But demanding a false precision from an analysis process that is itself incorrectly modeled on a common misunderstanding of the methods of science is not likely to improve the quality of analysis. Indeed, an important issue for both managers and users of analysis to consider is the likelihood that there may be little concordance between precision in the details of the answer and the accuracy of the overall (*gestalt)* judgment. A process and methodology too focused on provable evidence may get the details right at the cost of ignoring important inferential judgments that need to be conveyed in order to provide a true sense of the uncertainties of both evidence and judgment.[26]

A process and methodology too focused on provable evidence may get the details right at the cost of ignoring important inferential judgments.

[21] The term "scientism" is used to connote the frequent confusion between the appearance of a formal scientific methodology and the actual conduct of science, which may be intuitive, but is nonetheless subject to rigorous proof.
[22] Mark Stefik and Barbara Stefik, *Breakthrough: Stories and Strategies of Radical Innovation*, 110.
[23] The Stefiks are referring to Peter Medawar's article, "Is the Scientific Paper Fraudulent? Yes; It Misrepresents Scientific Thought," published in the *Saturday Review* 47, 1 August 1964: 42–43.
[24] Stefik and Stefik, 110–11.
[25] Allen.
[26] For more on this subject, see the section on "Evidence-based Scientism" in Chapter Three.

The Flaws of a "Tradecraft" Culture

Intelligence analysis remains largely a craft culture that is conducted within a self-protective guild system and taught by means of a broken apprenticeship process. There are other fields, such as science, medicine, and warfare, in which knowledge is also understood to be tentative and not subject to formal "proof," as is possible in mathematics. Within such professions, the cumulative practices, habits, and mindsets of an evolved culture are especially important for the creation of knowledge and the transmission of expertise. As with intelligence, these other communities are ones in which much of the knowledge needed for effective performance relates to the often-arcane processes of the craft (tradecraft, as the Intelligence Community terms it). This knowledge is tacit and difficult to elicit from the experts, and it is usually best communicated by personal example and practice.[27] However, the culture of intelligence lacks many of the formalized processes, such as "peer review," and the cumulative knowledge structures that the academic, military, and medical communities have created to address similar challenges in building a solid foundation of understanding that can be passed to successor practitioners. Perhaps for these reasons, intelligence analysis is not yet a true profession. Within this culture, therefore, effective mentorship is especially important for transmitting expertise and, perhaps more significantly, for imparting professional standards and values to apprentices.

[27] The professions of medicine and law refer to themselves as "practices," which reflects their roots in the guild system. More importantly, perhaps, this usage conveys that the essential elements of a profession (ethos, ethics, and skills) are human values best transmitted by people.

Chapter Three: An Inventory of Analytic Pathologies

Although many of the reform proposals responding to the recent intelligence failures took diametrically opposed positions with respect to the role of the DCI, the creation of the DNI, and the functions of the CIA within a "transformed" Intelligence Community, they were mostly quite similar in that they focused both on wiring diagrams and formal authorities as the mechanisms for reform and on creating a "czar" to execute those authorities through centralized management.[1] As is often the case, reform legislation took a structural route to address problems that flow from dysfunctional processes, inbred cultural practices and habits, and failures of human leadership.

Although the legislative changes have restructured the community, other than emphasizing "competitive analysis" and more HUMINT, the IRTPA contains little significant language about reforming the internal functional processes of intelligence—collection and analysis. The legislation failed to take into account several key distinctions that any intelligence reform proposals must recognize: differences in issue domains; tactical vs. strategic consequences; narrowly focused vs. synoptic collection and analysis; reporting vs. deep analysis; immediate vs. long-term decision horizons; foveal vs. peripheral perception; action vs. exploitation; and defined, tasked requirements vs. speculative information gathering.

Some recommendations, in fact, could aggravate the already dysfunctional conditions, further damaging analytic capabilities. The IRTPA directed the establishment of centers for priority issues, as recommended by the 9/11 Report, but these are likely to place even more emphasis on current intelligence, whether or not this was intended. Integrated centers combining operators and analysts do foster better sharing and collaboration among them, but they invariably place the emphasis for analysts on operational support. Moreover, creating static structures and rigid processes designed to deal with fixed areas or issues is not a particularly sound response to events and conditions that are very fluid and fuzzy. These can be better handled by operating within a process that allows flexibility and discretion. Finally, with an already severe shortage of effective managers and experienced intelligence officers (including analysts, operators, and collectors), establishing more centers with mandated institutional positions and priorities can only further dilute an already over-stressed cadre of intelligence professionals.

. . . establishing more centers with mandated institutional positions and priorities can only further dilute an already over-stressed cadre of intelligence professionals.

An Inventory of Analytic Pathologies

Curing analytic shortcomings cannot be done by making minor modifications to the existing processes or even by wholesale replacement or upgrading of the analytic cadre.[2] Although it may be tempting to focus on better educating and training the analysts—the better for them to be able to "connect the dots"—altering the analytic model and the processes on which that model relies is almost certainly a more appropriate response to the profound problems besetting intelligence analysis. Without fixing the fundamental shortcomings in analytical processes, the system will always depend on the ability of individuals to work around the impediments, which adds additional stress to an already burdensome set of tasks.

[1] See, for example, a bill proposed by Rep. Jane Harman, the "Intelligence Transformation Act of 2004" (HR4104): "The goal…should be to enhance the DNI's ability to coordinate and integrate operations, focus the community on priorities, share information better…and so on, but not detract from the support that cabinet secretaries need and expect from their intelligence organization, and not dilute competitive analysis."

[2] One excuse for the very heavy cuts in mid- and senior-level analytic cadres in the early 1990s was that it was necessary to weed out those whose expertise was presumed to be passè and, therefore, no longer needed.

At the same time, it should be acknowledged that there are limitations on the depth and quality of the expertise available within the community. The past decade has shown that the Intelligence Community is likely to find itself behind academic and commercial sectors in many frontier areas simply because, for the most part, that is where these frontiers are first explored. Furthermore, given the unpredictable nature of emerging challenges and the often short response time they allow, the community is unlikely to have on hand sufficient regional, cultural, linguistic, technical, or specialist expertise to meet high priority threats to our national interests. Therefore, unless community management decides to forgo having all needed expertise within the community—to open its boundaries, remove the barriers, and create mechanisms to draw on external expertise and knowledge—these impediments to exploiting outside expertise will frustrate its ability to meet emerging mission challenges.

Interestingly, even if the old analytic methods and processes developed during the Cold War were themselves capable of addressing the emerging security challenges of post-Soviet adversaries, a review of postmortems of intelligence failures prior to 9/11 and the Iraqi WMD fiasco showed that these processes and procedures were routinely violated, frequently leading to failures.[3] In addition to shortcomings in the basic analytic paradigm and processes, according to the study, the system lacked enforceable self-correcting features and functioning compliance mechanisms. This suggests that there has been a more fundamental failure in leadership and in the basic institutional and management mechanisms for assuring effective performance of oversight, assessment, accountability, and responsibility. That these failures persisted for so long should be of concern to members of the analytic community, their leadership and management, and the oversight bodies as well. It is a warning sign that better oversight and enforceable compliance procedures are needed, because the analytic community itself may no longer possess the internal self-discipline or professional standards to do so.[4] This also clearly implies that greater attention to professional ethos and standards must be an integral part of efforts to transform analysis.

Indeed, well before 9/11, several articles written by experienced community officials pinpointed fundamental shortcomings within the community's analytical capabilities and highlighted dysfunctional processes as the causes.[5] Thus, the longstanding failure modes within the existing intelligence analysis paradigm must be identified and corrected, along with the management and oversight procedures, if the community is to meet new needs.[6]

Two elements of the current paradigm are especially worthy of attention. ***First is the inefficiency of the "account" structure.*** The account system, by its very nature, creates institutional and individual "ownership" of important intelligence domains. The ben-

[3] See Jack Davis, "Improving CIA Analytic Performance: Strategic Warning," and "Improving CIA Analytic Performance: DI Analytic Priorities."
[4] Several retired, formerly very senior, CIA officials have made this point about erosion of professional élan—ethos, ethics, and standards—that help keep the analyst from, as General Kent put it, succumbing to the temptations of prostitution or proselytizing (see footnote 43 on page 22). One attribute of a profession, especially a "learned profession," is that members can work without supervision. This is also one of the characteristics that define journeymen in a craft system.
[5] Carmen Medina, "What To Do When Traditional Models Fail," *Studies in Intelligence* 46, no. 3 and Russ Travers, "The Coming Intelligence Failure," *Studies in Intelligence* 40, no. 2.
[6] See Berkowitz, 3. That each organization develops tradecraft and evolves practices that may not transfer easily if challenged by new functions complicates the community's ability to shift its focus and assets to meet new challenges.

efit is that it provides a basis for accountability; the disadvantage is that ownership inhibits sharing, cooperation, and collaboration. It has also encouraged "stovepiping" by collection discipline and the control of information by collectors through originator-control (ORCON) restrictions. A fundamental redesign of analysis should start by dismantling both the notion of information ownership and the paradigm of "accounts," while maintaining accountability for performance; information must become the common property of the community, and someone with authority must oversee sharing and configuration management.[7] Such changes are likely to involve altering the existing institutional mechanisms in order to forge interagency virtual "clusters" to perform the analytic functions while creating "mission managers" with the authority to assure that important subjects and user needs are properly serviced.

The second element is the Intelligence Community's strong cultural orientation towards an "evidence-based scientism." Although this approach may be appropriate for the current intelligence functions that rely heavily on gisting and reporting and dominate both SPO and SMO, it clearly limits the ability of analysts to address the anticipatory intelligence needs of decisionmakers, which usually demand more reliance on judgments and inference chains and less on specific evidence. In return for more focus on the WEI role, decisionmakers who rely upon anticipatory intelligence must realize its inherent properties and limitations and be prepared to accept greater uncertainty in assessments and estimates in order to obtain better *gestalt* understanding.[8]

We need to understand that "warning" is largely built on modeling (either explicit or implicit) and synthesis, which are deductive processes, and not on analysis, which is an inductive process. In all cases, analysis processes should also access more non-traditional sources and incorporate a wider range of information to construct corroborative fabrics that can confirm or disconfirm critical information and hypotheses. The rigor and strength of these methods must rely less on narrow tests of the quality of the evidence or adherence to formalisms than on analysts being sufficiently "mindful" to recognize the pitfalls they may encounter in blind application of approved methodologies.[9] In addition, there is a huge research literature on decisionmaking under uncertainty that could be exploited to introduce innovative techniques for analysis and decision support. What all this comes down to, however, is not to disregard the need for rigor of method and quality of evidence, but, rather, to suggest that a construct of analysis too narrowly tied to a misunderstood "scientific method" needs to be augmented and leavened with intuition, curiosity, and a thirst for discovery—all essential elements of good science.[10]

Beyond these two fundamental changes, eight other problematic features of the current intelligence environment need to be addressed.

A fundamental redesign of analysis should start by dismantling both the notion of information ownership and the paradigm of "accounts."

[7] Creation of an "information commons" must be done in full awareness of the problems associated with the conundrum of commons, the conflict for resources between individual interests and the common good. Garrett Hardin, "The Tragedy of the Commons," *Science* 162 (1968): 1243–8.
[8] It is like the saying, "better to be approximately correct than precisely wrong." Josh Kerbel, "Thinking Straight: Cognitive Bias in the US Debate About China," *Studies in Intelligence* 48, no. 3 (2004).
[9] In this regard, several commentators, among them Sabel, Fishbein, and Treverton, have recognized the potential applicability of practices drawn from "High Reliability Organizations" (HROs). Both this issue and "mindfulness" will be addressed in greater depth in Chapter Four.
[10] This thought owes much to comments by Stephen Marrin in a private communication on 1 November 2004.

3. The Tyranny of Current Intelligence

Over the past decade, the Intelligence Community's efforts to be responsive to its customers' demands for current intelligence have dominated collection and analysis. As a senior analyst noted, "The Intelligence Community really [is] focused on current intelligence, on policy support. It does very little research. It has very little understanding below the level of the policymaker and, in my view, on many issues. I think that, in some ways, these two groups are reinforcing each other's worst habits."[11] The disappearance of the long-term Soviet threat and the chaos of the post-bipolar geostrategic environment shifted policymaker interests to a series of *crises du jour*. Policymakers demanded that intelligence for their current problems receive priority as the US and Allied interventions in Somalia, Haiti, Bosnia, Kosovo, and elsewhere proceeded. At the same time, the Pentagon's increasing demands for support in ongoing military operations, including such prolonged activities as *Northern* and *Southern Watch* in Iraq, placed tremendous demands on the intelligence system for a continuing stream of timely support products.[12]

Prior to the 1991 Gulf war, no commanders of regional or functional military forces—other than those for strategic forces—could expect to receive direct and timely support from national assets, especially to support tactical operations.[13] That war, and the glimpse it provided of the power of modern information systems to overcome shortcomings in C4ISR (command, control, communications, computers, intelligence, surveillance, and reconnaissance) fueled an intense push to obtain "information superiority." This, in turn, created nearly insatiable appetites among military commanders for real-time intelligence support and gave birth to the concept of "net-centric warfare" (NCW).[14] Many of the new C4ISR systems (including national systems), and much of the effort and funds expended by the Intelligence Community since the Gulf War, have focused on providing direct, real-time support to forces engaged in combat by closing the "sensor-to-shooter" loop and to meeting the information needs of the senior-level commanders directing those operations. When there are American forces deployed in active military operations, as there have been on a near-continual basis since the end of the Cold War, the highest priority is now accorded to providing intelligence to support them.

4. Overemphasis on Production

At the same time as demands to support military operations generated huge requirements across the Intelligence Community, standing collection and analysis requirements to fill databases and to produce routine scheduled products set priorities for a substantial part of the intelligence "phase-space." The entire intelligence system is dominated by the demands of processing

[11] *Intelligence and Policy: The Evolving Relationship*, Center for the Study of Intelligence, June 2004, 7.
[12] These are not new problems. Defense Secretary Donald Rumsfeld, as chairman of the Commission on Ballistic Missile Threats, highlighted the failure of executive and legislative leadership to establish appropriate priorities while besieging the community with ad hoc taskings. See Side Letter to the Rumsfeld Report, 18 March 1999, 2.
[13] Those needs and the impediments on access to national systems underwrote the very large military programs known as TIARA (Tactical Intelligence and Related Activities). National systems are also known as National Technical Means, the term used to refer to them in arms control agreements.
[14] In *Network Centric Warfare: Developing and Leveraging Information Superiority*, David S. Alberts, John J. Garstka, and Frederick P. Stein define NCW as "an information superiority-enabled concept of operations that generates increased combat power by networking sensors, decisionmakers, and shooters to achieve shared awareness, increased speed of command, higher tempo of operations, greater lethality, increased survivability, and a degree of self-synchronization. In essence, NCW translates information superiority into combat power by effectively linking knowledgeable entities in the battlespace."

huge amounts of information gathered by collection systems whose architecture was largely designed during the Cold War to address a very different problem. This huge inflow created a production-oriented model and an "efficiency paradigm" better suited to the "Industrial Age" than to the Information Age of the Twenty-first century.[15] The volume of collected intelligence is so vast that, even with automated assistance, human analysts can effectively review and evaluate only a small part of the flow.

The existing paradigm for intelligence analysis and dissemination still relies largely on published paper reports as the mechanism for delivering products to users. Furthermore, without effective metrics to assess the value of intelligence to decisionmakers as well as the impact of analysis on the quality of their decisions, it is simple measures of data collected, traffic processed, and reports produced that have influenced critical decisions on priorities and resource allocation within the Intelligence Community. Meeting the new challenges will require a greater emphasis on adaptability and agility, as well as processes that are better able to respond to non-routine requests and high-priority challenges. The price to be paid for this, however, may be a reduction in efficiency as measured by the usual output-oriented metrics of mass-produced products normally used in cost-benefit calculations of routinized processes. Such calculations underweight the ability to meet unexpected situations and the "slack" that is usually essential in an adaptable organization.

5. Over-Reliance on Previous Judgments

The problem of "finished intelligence" stems from the conceit that any intelligence product is more than a snap-shot of knowledge believed to be true at that time and that "finished intelligence" is, by virtue of the formal coordination and review processes, "truer" than the pieces of raw intelligence from which it was built. The roots of this conceit date back to the period when the Intelligence Community was seen to possess domain expertise found neither in its user communities nor outside government, and its assessments could be considered authoritative. During that period, the Sherman Kent posture of standing apart from policy users could be considered an appropriate style. Fully coordinated "finished intelligence" products, such as NIEs, do convey authoritativeness as the *current, agreed judgment* of the Intelligence Community. These products also carry a sense that they and their conclusions can stand the test of time. These latter assumptions, however, are not necessarily warranted. As most "finished" intelligence products involve substantial interpretation, analysis, synthesis, and judgment, and they are more likely to have lengthy inference chains that compound uncertainty issues in more fragmentary reporting.

The validity of the earlier judgments expressed in finished products is especially important because of the common practice of "layering," that is, using previous, formally coordinated products as the starting point for new assessments and estimates.[16] Although this practice helps to assure the consistency of an analytic line, building on established judgments or on prior positions of an analyst, branch, group, office, or agency is also a reason to be wary. As a former senior intelligence official noted,

[15] Sabel, 52ff.
[16] See Conclusion 4, *SSCI Report*, 22–23.

> *Judgments which any analytical actor has the greatest incentive to defend must be subjected to the most critical scrutiny.*[17]

The danger arises because, unlike academic practice, there is no sustained or sanctioned process of after-the-fact ("ex post facto" or "ex post") review. Finished products are rarely subjected to a considered re-examination, nor do they receive explicit testing by other parties trying to replicate their findings—unless there is an obvious major intelligence failure. Moreover, errors that are recognized subsequent to publication are often not corrected, by means either of timely notification to readers or of corrections fully incorporated throughout the knowledge base.[18] Other knowledge intensive enterprises, such as law, medicine, and science, also depend on cumulative foundational knowledge; but they do far better at maintaining the accuracy and currency of these critical intellectual resources than does the Intelligence Community.

The community too often treats probing questions as attempts to "shape" (that is, "politicize") analyses rather than genuine inquiries into the quality of evidence and the strength of inferences.

Even a cursory reading of the report on Iraqi WMD highlights the mutually reinforcing dangers of the "finished intelligence" conceit and of "layering." Too often, the presumed authoritativeness of a formal product leads users to accept its judgments as established and its underlying evidence as validated. These products then become the baseline for updated assessments, and, as a result, the cumulative impact of errors is amplified and becomes pervasive.[19] In fact, the conceit is even more damaging to the effectiveness of the Intelligence Community in an era when policymakers are increasingly likely to be their own "senior analysts" and may not believe that "finished intelligence" represents the final word on a topic. Today, these officials bring other information and their own expertise to the task of arriving at a comprehensive judgment, and intelligence material is only one input into that process.[20] Yet the community too often treats probing questions as attempts to "shape" (that is, "politicize") analyses rather than genuine inquiries into the quality of evidence and the strength of inference chains.

6. The Neglect of Research

This emphasis on current intelligence, with its consequent time pressures and the methods needed to meet production demands, has produced a range of distorting effects that are not fully recognized.[21] First, it has severely undercut the ability of analysts to do in-depth research by requiring that most analytic effort be devoted to short-term taskings. Second, by denying most analysts the opportunity to work on deep products under the tutelage of a senior mentor, this emphasis has damaged a key element of the indispensable apprenticeship process, a *sine qua non* for effectively training and developing professionally competent intelligence practitioners. Third, in order to meet daily requirements, the production aspects of the current intelligence cycle have been accorded undue priority.[22] Fourth, the emphasis on current intelligence helped to create an incentives and rewards system for the analysts biased towards short-term reporting rather than deep analysis. And, fifth, without explicit management support, the time pressures on, and implicit incentives for, analysts to focus on current

[21] See Chapter Four for a more complete discussion
[22] This is also a problem for newspapers, and it explains why newspapers, with their daily production cycle, are different from magazines, which can afford to pay more attention to sustained investigative journalism.

production have made the pursuit of curiosity difficult. In contrast, within the scientific community, "investigator-initiated" research is a primary contributor to discovery and innovation, as well as a powerful factor in validating the research of others. The Intelligence Community has need of just such a procedure.

Over the past decade, the Intelligence Community has made several attempts to redirect attention to long-term research and products that reflect such efforts, but, without a sustained base of interested customers in the senior policy community, these have not succeeded.[23] Analysts have seen the emphasis on the President's Daily Brief (PDB) and similar serial products as a clear indication of where interest (and therefore success) is to be found.[24] Although some suggest that current intelligence can provide the basis for deep understanding, it seems obvious that attempting to achieve this by compiling current reporting is not a satisfactory method for producing integrated, synoptic analyses that are set in full context. A better route to meeting the competing demands of producing both current intelligence and deep analytical products would be to exploit the expertise and domain understanding of the experienced analysts doing in-depth research to identify, select, extract, and put into context the important tidbits from the reporting stream—and to use those as a basis for more in-depth and sustained exchanges with users of intelligence.

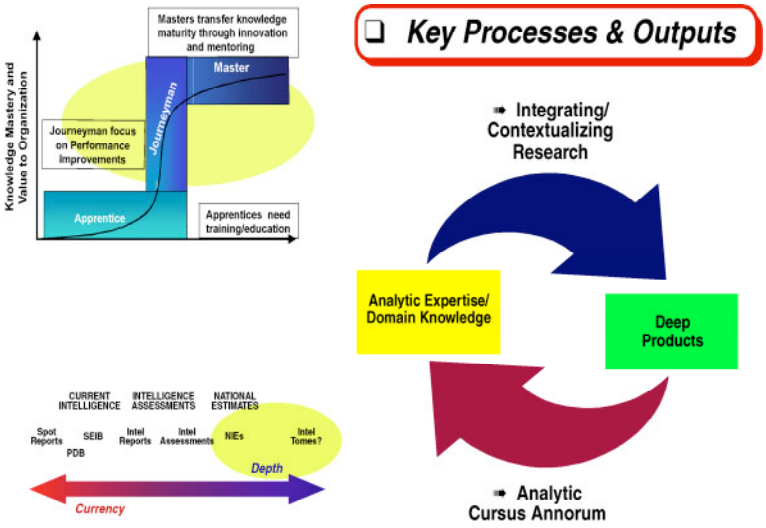
7. The Neglect of Anticipatory Intelligence

The "information revolution" has unsettled intelligence officials by providing policymakers with alternative sources for both coverage of developments and in-depth research and understanding on issues of interest to them, as well as allowing them to become their own intelligence analysts, if they so choose. These trends have left Intelligence Community managers struggling to emulate the success of television as the provider of real-time news and has prompted the worrisome notion that customers might now see intelligence as less relevant. But the community must go beyond the current interest areas of its customers if it is to perform its primary national function of preventing surprise. In the new and very dynamic geostrategic environment, perhaps the most important element of warning is the anticipatory function against the unexpected—*discovering* new activities that might prove inimical to US national interests and obtaining information about them. Leads to issues of this kind are not likely to come from customer requests; as noted, in science, "investigator-initiated" research is a particularly important driver for discovery and innovation.

Waiting on the policy community to furnish requirements for anticipatory intelligence all but assures that there will be serious warning failures.

Correcting this problem demands that the leadership of the Intelligence Community be prepared to spend real resources on issues that are not immediately "customer-relevant," even when confronted by what seem to be limitless demands to focus on high-priority subjects. Waiting on the policy community to furnish requirements for anticipatory intelligence all but assures that there will be serious warning failures—and the commu-

[23] See Douglas MacEachin, "The Tradecraft of Analysis: Challenge and Change in the CIA," *Studies in Intelligence* 46, no. 3 (2002): 23–28. It is also interesting to note that the NIE on Iraqi WMD was requested by the Senate Select Committee on Intelligence and the Senate Armed Services Committee, not by executive branch policymakers.
[24] See Rob Johnston*, Analytic Culture in the U.S. Intelligence Community.* Indeed, in response to these concerns, the Commission on the Intelligence Capabilities of the U.S. Regarding Weapons of Mass Destruction strongly urged that the PDB not become the centerpiece of the DNI's analytic focus.



Graphic courtesy of SAIC

nity will shoulder the blame for the policymakers "surprise." Faced with its concerns about diminishing relevance, the anticipatory role is one the Intelligence Community should grasp. At the same time, the dichotomy between current situational awareness based on a stream of detailed reporting and anticipatory or predictive intelligence is more apparent against a new enemy who relies on "stilettos and stealth" than it was against the Soviet Union, which amassed large stocks of advanced weapons whose visible and patterned development path took well over a decade and then allowed us to collect hard evidence on them by exercising those capabilities extensively. For a community which frequently restates the mantra that it is "an evidence-based" culture, this divergence of reduced collection capabilities against lower signature targets and the increasing demands for anticipatory judgments resting on long inference chains will create an uncomfortable problem in producing these assessments.

8. The Loss of "Keystone Species" and "Intellectual Middleware"

The relatively recent ecological concept of "Keystone Species" denotes organisms that play a central role within an environment, either as a resource or as a control mechanism. Within the Intelligence Community, the most important of these "keystone species" is perhaps the "journeymen" analysts.[25] These experienced analysts (say, those with seven or more years of analytic experience) are the functional equivalent of doctoral students, post-doctoral fellows, and assistant professors in academia and of the house staff (interns and residents) in medical education, both of which are also guild/craft systems. Journeymen perform the bulk of the work of producing products, making incremental improvements in process, teaching the apprentices, and disseminating knowledge and skills as they move to new communities. The journeymen carry institutional memory, transmit knowledge to junior analysts, and inculcate in them such vital professional values as intellectual curiosity, humility, and an ethos of continual learning. In addition, they form the core of a high-trust social network built on longstanding prior contacts that is essential to the diffusion of knowledge within the Intelligence Community and the national security community as a whole.

Recognizing the journeymen's role as a "keystone species" helps to explain the severe disruptions caused by the disproportionate drawdown in their numbers triggered by the budget cutbacks of the early 1990s. To a con-

[25] "Journeyman" is not used in a pejorative sense, but, rather, in the traditional guild meaning of the term. In CIA parlance, these are now called "fully qualified" analysts. Military homologues are Navy chief petty officers ("chiefs") and Marine gunnery sergeants ("gunnies").

siderable extent, this cadre, with its deep professional expertise, was sacrificed because of the disinterest of the policy community; nonetheless, the senior management of the Intelligence Community allowed it to happen. Moreover, increasing pressures for "broadening" rotational assignments and "up-or-out" promotion policies make it more difficult to retain the remaining cadre of deeply skilled experts as working analysts.

The loss of journeymen also underscores the crucial importance for the analytical profession of soft cultural factors and people-related processes, such as mentoring. Inadvertently, as mentors disappeared, the important socialization and professionalization processes that are essential to train, guide, and acculturate the current flood of apprentice analysts went with them. A further difficulty is that, absent either emphasis on, or demand for, research products, the departure of experienced analysts and the focus on current intelligence and reporting makes it difficult to train and mature newcomers in creating such deep products.

As a consequence, the community also lost the "intellectual middleware"[26] that was a central element of its knowledge base and what one former senior intelligence officer terms its "ecology of expertise."[27] Intellectual middleware is the profound complementary understanding of both domain and process that is gained from long experience. Along with the knowledge base built-up over years, middleware is a necessary link between current intelligence and deep understanding of a domain; it provides the essential capabilities necessary for either considered in-depth judgments or meaningful quick-response products. As a conference participant with extensive analytic experience noted, "Dick Kerr did a study…of all the analysis that was written on Iraq [by the CIA]…. He said…it was very good, there was a lot of detail, there was a lot of information, but he came away from all that analysis having no real sense of what Iraq, the country, was all about."[28] Of course, working on research projects contributes to the production of middleware, which, in turn, serves as a resource for all other products and advice; this is something that working on a succession of current and limited studies can never do.

The Intelligence Community once had a fairly standard method for introducing analysts to the process of research, which was to have them draft a new edition of a lengthy product known as a National Intelligence Survey (NIS). Working on a project such as this created in-depth analytic expertise and domain knowledge on a country or area. Above all, the knowledge gained by producing an NIS would enable an analyst to provide policymakers with the essential context for current intelligence, to render informed judgments, and to produce timely answers to important questions. Unfortunately, the importance of the NIS process was not recognized within the community, and the practice was abandoned.

9. Failure to Develop Analytic Tools and Methods for Validation

Most of the tools available to support analysis provide help for specific analytic techniques or intelligence disciplines, such as

[26] This term from the computer science community denotes software that performs intermediary functions (such as translation and data exchange) between heterogeneous systems, enabling them to function in an integrated, interoperable manner. The connotation of middleware is "glue" that enables not just interoperability but, in this context, also cross-fertilization.

[27] This concept of an "ecology of expertise," articulated by Fritz Ermarth, is a powerful tool for thinking about the Intelligence Community's role.

[28] See *Charlottesville Conference Report*, 6 and Kerr, et al.

imagery intelligence (IMINT) and signals intelligence (SIGINT), rather than for all-source analysis. Even so, there are formal methodologies taught and employed within the community for all-source analysis, especially for assessing and marshalling evidence, and there are structured methods that support hypothesis assessment.[29] Consistent with its "craft" culture, the Intelligence Community has used practical experience rather than formal validation methods to assess utility and select these tools. Rob Johnston has observed, however, that there is a large number of tools and methods available to the analytic community, but few are consistently employed—and none has been tested or validated to assure its effectiveness and utility.[30] As one seasoned analyst commented, "… imagine a nuclear powered Navy in which all the Reactor Plant Operating Manuals are written by the current ship's engineer and whenever he got relieved they were all shredded and the new engineer had to write his own."[31] Of course, as has often been noted by students of intelligence, that an agency or community opinion is wrong does not automatically mean that the process followed in reaching that opinion was flawed.[32] Again, quoting Charles Allen,

> *We're not very good at evaluating the quality of intelligence analysis independent of the outcome. We're outcome oriented, rather than process oriented.*
>
> *Conversely, when the policy succeeds and a desirable outcome occurs, we feel satisfied with the conduct of intelligence and generally look no further. The cumulative effect of this process is that it undermines the very essence of intelligence analysis.*[33]

Within the diverse domain of intelligence analysis, one would expect that analytic methods and tools would vary significantly, not only depending on the sources of intelligence available and the subject matter, but also on the epistemology of the question at hand—whether the problem is, to use Fritz Ermarth's typology, a secret, a mystery, or an obscurity. "Secret" means the information exists but must be acquired—usually by clandestine collection methods—and interpreted. A "mystery" is a question for which a set of possible outcomes may be known but whose particular outcome can be known only after the fact. An "obscurity" involves questions that are often unrecognized and not seen to be relevant until they are posed explicitly—which requires curiosity, a quality often in short supply. Data to illuminate obscurities are also often available—even if found in non-traditional sources that require imagination to identify, if procedures to filter signal from noise can be developed, and if appropriate inference chains can be constructed from the evidence. For example, Murray Feschbach drew accurate inferences about the internal strength of the Soviet system from totally "out-of-domain," low-level, openly-available statistical data on morbidity and mortality published by the Soviets themselves.[34]

The Intelligence Community, however, as a function of its history and culture, has constructed a "hierarchy of privilege" for information that still gives the most weight to

[29] See, for example, Hughes and Schum, "Evidence Marshalling and Argument Construction."
[30] Johnston, 72.
[31] Private communication from John Bodnar.
[32] Put another way, "There are too many targets and too many ways of attacking them for even the best intelligence agencies to discover all threats in time to prevent them from happening." Kerr, et al.
[33] Allen, 3.
[34] See, *inter alia*, *Russia's Health and Democratic Crises* and *Russia's Demographic and Health Meltdown*. Feschbach is currently a senior scholar at the Woodrow Wilson Center and Research Professor Emeritus at Georgetown University.

secret intelligence. Similarly, many users of intelligence information accord greater credence to reports with higher levels of classification. And, of course, the Intelligence Community often perceives its comparative advantage with decisionmakers in secret information that only it can access and supply. At the same time, unfortunately, the more evidence and judgments are restricted in dissemination by compartmentation and distribution limitations, the more likely it is that questionable judgments will pass unchallenged. This is an especially serious problem for HUMINT, which, by its nature, provides only a very narrow perspective on events for which direct confirmation may not be available. Yet timely, authoritative, and credible HUMINT is sometimes—however rarely—the only way to obtain information that can determine strategic direction.

10. The Hindrances of the Security Mindset

The current security mindset is an additional impediment to cooperation among and within intelligence agencies, between intelligence agencies and policy agencies at all levels of government, and between community analysts and outside expertise resident in both non-government and foreign sources. This mindset is extremely risk averse with respect to potential information loss, and it fosters procedures that make it difficult to pull together and share files of relevant information, to bring fresh perspectives to bear, and to exploit the synergies of expert collaboration. This current security paradigm views problem domains as discrete and separable and insists that protection of information (and, therefore, sources and methods) is more important than effective exploitation and cross-fertilization. Two problem areas, in particular, are the traditional barrier between the intelligence and law enforcement functions and between foreign and domestic intelligence. Under the pressure of countering the terrorist threat, however, these distinctions are eroding.

The Intelligence Community often perceives its comparative advantage with decisionmakers in secret information that only it can access and supply.

Chapter Four: A Program for Transforming Analysis

The following sections lay out some fundamental guidelines, or pathways, for transforming analysis, provide a set of principles upon which to base a restructured analysis paradigm, and suggest six specific areas for attention.[1] To be effective, however, necessary changes need to be implemented within the system, not just identified. Even a cursory look at the fate of previous Intelligence Community reform efforts does not lead to expectations of great success in such an endeavor. For this reason, the path suggested here offers the opportunity to make some early course corrections that can be initiated without formal sanction and with minimal changes to existing structures and authorities.[2] It also offers the possibility of winning support from the professional intelligence cadre, who must be convinced that the measures recommended are both effective and sensible. If they are not convinced, institutional inertia, if not outright resistance, will impede change. For example, groups of analysts could take ownership of these areas proposed for action, thereby legitimating the transformation effort as an organic program instead of one imposed from above.[3]

Developing a New Concept for Analysis

Several recent assessments contend that the Intelligence Community's problems are manifestations of fundamental and systematic problems within each agency's internal processes, cultures, and organizational structures.[4] Moreover, these shortcomings do not result from a flawed community architecture or from insufficient directive authorities and budgetary control over the community as a whole—although they may be aggravated by them.

There are two fundamental challenges in rebuilding analysis, with a substantial degree of contradiction and inherent tension between them. The first is to avoid being confidently wrong (as in the NIE on Iraqi WMD) by staying closer to available evidence. The second is to provide judgments on complex and often unfamiliar adversaries and on their likely behavior based on fragmentary and frequently ambiguous information (as in the circumstances leading up to the 9/11 attack).[5] The community has still not made the shift to recognizing that the dominant intelligence problems are not penetrating "denied areas," but rather understanding "denied minds." This shift requires rethinking not only the types of information that analysts need, but also the nature of the information gathering necessary to provide that information. In terms of the latter, intelligence practitioners will need to accept that the appropriate mechanisms will not be limited to remote clandestine collection systems or case officers.

The community still has not recognized that the dominant intelligence problems are not penetrating "denied areas," but understanding "denied minds."

The larger issue of how to allow a classic hierarchical organization to meet the challenges of a more fluid environment and dynamic networked adversaries must be faced squarely, but it is also an effort well beyond the scope of this study. Recognizing that this factor is important, however, the discussion below does focus on directly addressing the sources of analytic failures, including several problems stemming from a hierarchical organization model that has been both badly applied and misapplied.

[1] A comprehensive discussion of remedial measures is beyond the scope of this paper.
[2] Several reviewers, all of whom are experts in management theory and organizational behavior, suggested this idea in parallel.
[3] See Michael Mears, "The Intelligence Community Genome: RIA Paper #3." It is an insightful look at the practical challenges of organizational transformation in the Intelligence Community.
[4] See Jeffrey Cooper, "Intelligence & Warning: Analytic Pathologies," and Johnston.
[5] See Kerr, et al. for a more extensive discussion by seasoned analysts on improvements needed in analysis.

The primary purpose of analytic effort is "sensemaking" and understanding, not producing reports. . . .

Principles for a New Paradigm

A new paradigm should start with a set of basic principles to guide the rebuilding process, restore professional standards to the conduct of analysis, and help redress the effects of evolved dysfunctional practices. These principles should be mutually agreed between the leadership of the Intelligence Community and the cadre of professional analysts as the basis for an "analytic compact" that will affect priorities and taskings as well as incentives and rewards for performance. Furthermore, even if users do not fully agree, they also should understand these principles to be the foundation that guides the analytic community in its work. In the long-term, it is clearly in the interest of policymakers to rebuild the community's expertise and knowledge so that intelligence can provide highly contextualized and meaningful judgments, whether on current or future issues.

These principles ought, above all, to convey that "analysis" needs to be construed broadly and not solely in a narrow, "reductionist" context that seeks to "know" by decomposing a phenomenon into its constituent parts and approaching it analytically only on the basis of induction from detailed evidence. Many complex phenomena may be better comprehended by approaches that are based more on synthesis—that is, understanding the larger picture—by focusing on the relationships among the parts and on the emergent behavior produced by such interactions. These principles—which, of course, are not meant to be exhaustive—will recognize, therefore, that:

Philosophy and Values

- Analysts must have a "duty of curiosity," and the analytic process must encourage and reward a deep and meaningful understanding of the phenomena under investigation;
- Analysts must be responsible for defining knowledge needs and, therefore, collection requirements; to do this effectively, they must understand collection capabilities and be sensitive to their limitations;
- Analysts must be active participants in developing integrated strategies for collection and analysis, seeking information instead of being merely passive recipients;
- The primary purpose of analytic effort is "sensemaking" and understanding, not producing reports; the objective of analysis is to provide information in a meaningful context, not individual factoids;
- The knowledge discovered and the expertise created when an analyst researches a problem is at least as important as "finished intelligence" products that may result;
- Learning is an activity that is valued highly by both analysts and the organization;
- Not all intelligence need be immediately "actionable;" informing decisionmakers and enhancing the quality of the decision process is a critical objective;
- Intuition and creative thinking, including positing hypotheses to be tested, are as important to analysis as evidence-based inductive approaches.

The Overall Approach

- There are different analytic problems, and there are diverse approaches and methods for resolving them; in many cases, appropriate and intuitively usable tools may enable their consistent use and enhance the effectiveness of these approaches;

- There should be no assumed "hierarchy of privilege" of sources or analytic methods; a wider range of methodologies needs to be employed routinely and consistently, not seen as exceptional "alternative" techniques;

- Analytic tools are intended to support, not supplant, rigorous and structured cogitation by human analysts;

- There should be better access to, and exploitation of, open-source information as an element of all-source analysis;

- Deductive hypothesis-based methods should be employed more often as a complement to traditional evidence-based inductive approaches;

- There should be more use of formal tests of diagnosticity of evidence, thereby improving the ability to confirm or deny hypotheses;

- Collaboration during the analytical process should be routine, not exceptional, and workloads should be balanced accordingly;

- Review and assessment—including peer review—must be an integral element of the analysis and should not be conducted only after-the-fact;

- There should be greater recognition of the propaedeutic and heuristic roles of writing—as tools of discovery and learning—for the analyst; writing is not just a method of transmitting information to the user;

- Contrarian methods and "Red Teams" should be a routine part of the analytic process;[6]

- As opposed to the incremental approach, in which new evidence is assessed piecemeal for its effect on the course of judgments made, more use should be made of a "stock-take" approach, in which the entire collection of evidence is reviewed holistically;[7]

- "Process watchers," charged with recognizing cognitive impediments and process failures, should become integral parts of analytic teams;[8]

- In addition to reviewing products at hand, analytic managers and senior Intelligence Community overseers should subject the knowledge base and domain expertise to continual appraisal in order to assess whether the scaffolding of evidence and the inferential reasoning is sufficiently strong to bear the weight of the judgments being made and the policy decisions that may rest upon them.[9]

[6] Composition of the teams, however, might better be rotational and *ad hoc*. See also Kerr, et al., 52: "Indeed, although certain gaps were acknowledged, no product or thread within the intelligence provided called into question the quality of basic assumptions…."
[7] The "stock-take" originated in the UK atomic weapons program; it differs fundamentally from the more usual practice, which holds that new information will appropriately correct earlier judgments. But this approach, based on Bayesian logic, depends on the earlier "priors," which may never be carefully reexamined.
[8] Professor Daniel Kahneman, who teaches at Princeton University, also suggested this approach in the slightly different military "command and control" (C2) context in an interview with me in October 2000. Johnston discusses this approach at length in his chapter on "Integrating Methodologists into Teams of Experts."
[9] Fritz Ermarth made this suggestion in a communication to me on 23 January 2005.

Analysts should expect users to "pull threads" and question judgments in open dialogue.

Interaction with Users

- There may not be a "right" answer, and there may be limits on "knowability";
- Users are owed an honest assessment of the quality of evidence, uncertainties in judgments, and the "knowability" of the answer; transparency in the logic chain and application of evidence is essential;
- Such assessments can be better conveyed through conversation and dialogue than through static "finished" products;
- Analysts should expect users to "pull threads" and question judgments in open dialogue.

Management and Oversight

- Management's first responsibility should be to remove impediments to analysts' ability to function effectively; the core management function is to ensure the process is being followed and is adapting as necessary to changing needs;
- Commitment by analysts rather than enforced compliance by managers must become the driving force in renewed analytical practices;
- Management must be knowledgeable about the practice of analysis and must provide appropriately focused incentives for those they supervise;
- Managers must encourage self-awareness, questioning of existing procedures, and striving for continuous improvement;
- The organization should create a "learning environment"—not only for domain knowledge, but also for process and methodological expertise;
- The organization must encourage not only "near-miss" analysis and error detection, but also the consistent reporting of anomalies and errors;
- There should be toleration of first errors, but no tolerance for repeating the same mistake; being wrong will happen, but failing to learn should be subject to sanction.

Cautions and Precautions

- Self-awareness of cognitive biases and institutional prejudices, as well as a more self-reflective manner, should be intrinsic elements of an analyst's mindset;
- There is no "revealed truth," and assertion by reference to evidence or previous "finished" intelligence products is not proof;
- "Truth" is not held solely by the Intelligence Community, either here or abroad;
- "Truth" is also not necessarily the first priority of users' questions, but answers by analysts should be;
- Ongoing re-examination and revalidation of previous judgments is very important; unless care is taken to validate and maintain the currency of the library of finished intelligence, "layering" poses significant dangers for the analytic process;

- Keeping an open mind—framing multiple hypotheses and looking at different potential interpretations of "the evidence"—is essential if locking in premature judgments is to be avoided;

- Regardless of the apparent rigor of the process, an analyst must approach analytic issues with "mindfulness" of the potential pitfalls in evidence and analytic methods that are being applied to a particular problem;[10]

- Tools and methodologies should be tested and evaluated for analytic effectiveness and usability before adoption, and analysts should have an important role in evaluating them;

- Because "mindfulness" only goes so far in detecting one's own biases and cognitive failings, a supervisory function that watches over the conduct of the process is important;[11]

- Differences in culture and governance mechanisms are real—not all human actions are determined by Western notions of rational thought or Enlightenment values—and they affect societal and individual preferences and decision metrics.

Additionally, if at all possible, the first audience for the knowledge gained should be the peer "community of practice" rather than the policy users.[12] Too much focus on "serving the first customer" may have served to shortchange the depth of analysis and the rigor that would be demanded by knowledgeable peers. Moreover, analysis must pay more attention to how the knowledge is conveyed to the users while, at the same time, recognizing that the message should rest on a "sound story." The analytic process must reinstill a sense that the discipline of writing serves to discover the story, not only to convey it, and appropriate incentives to encourage these behaviors must be instituted.

Getting Started: Six Fundamentals

If at all possible, the first audience for knowledge gained should be the peer "community of practice" rather than the policy users.

This set of principles provides the basis for a systematic campaign to enhance analytic effectiveness in the three interrelated areas of people, process, and technology. The process dimension defines the characteristics and qualities of the enhancements needed in the people and technology areas, and that is the focus of this study. The people dimension must address, in addition to recruitment and training, impediments to good work and work practices, retention, and professional development, as well as appropriate organizational and institutional incentives to overcome them. The technology dimension must be centered around enabling and facilitating both the people and process dimensions, not simply on updating the technical infrastructure to move more data faster.

The corrective measures proposed here address six processes that are indispensable to restoring the Intelligence Community's capability to perform effective intelligence analysis. These proposals emphasize:

[10] See Warren Fishbein and Gregory Treverton, *Rethinking "Alternatives Analysis" to Address Transnational Threats.*
[11] The standard approach to addressing bias and prejudice in judgment and decisionmaking has been through training to recognize one's own cognitive errors. During my research on cognitive impediments to C2 decisionmaking for the Defense Advanced Research Projects Agency (DARPA), Professor Daniel Kahneman pointed out that this approach has not succeeded, despite more than 25 years of trying. Kahneman was awarded the Nobel Prize in Economics for his work on imperfections in decisionmaking. (Personal interview, October 2000.)
[12] This issue was highlighted in Rozak, *et al*.

1. A reconceptualized set of processes and procedures (including tools, methods, and practices) for analysis;

2. An integrated process for recruiting, training, educating, and professionalizing analysts based on a traditional graduate education model emphasizing close mentoring;

3. A new, more interactive process for communication between users and intelligence analysts throughout the intelligence cycle;

4. A fundamentally revised process for establishing "proof," validating evidence and judgments, and reviewing those judgments;

5. A process for capturing the lessons of experience and advancing organizational learning; and

6. A process for continual collaboration and sharing.

A Revamped Analytic Process

Effective intelligence analysis requires the coupling of deep expertise with innovative approaches and intuition instead of the constraining formalism of "scientism." Although adopting methods of alternative analysis[13] and setting up red teams are a useful start, creating a more coherent structure and a demanding, self-reflective analytic process must also involve more than calls for lateral, out-of-the-box, or non-linear thinking on the part of individual analysts. Real change must alter the very modes of thought that dominate the expectations and practices of today's users, managers, and creators of all-source analysis. Both "sensemaking" and curiosity should be basic elements of this transformed paradigm.[14]

Models already exist for such a new paradigm, as a review of other domains in which failure of work processes can have large potential adverse consequences demonstrates. These domains fall into two distinct categories: 1) where the standardized procedures may not be sufficient to prevent routine but costly failures and 2) where routine procedures are clearly insufficient to face extraordinary conditions. In all of these models, however, the salient features are a high degree of self-awareness, emphasis on early error detection and correction, and the ethos of a "learning organization."

In the first category are organizations, such as those engaged in manufacturing and transaction processing, which specialize in maximizing the effectiveness of routine operations through continuous attention to improvements in the process. For these organizations, even small variances in outcome are a signal that routine procedures need to be adjusted, or significantly altered, in order to correct errors that cumulatively could become worrisome. These organizations have adopted the emphasis of the Quality Movement on consistent, continual self-examination and improvement; perhaps the best known of these is Toyota with its formalized *kaizen* (continuous improvement) system. Other organizations have implemented similar techniques; among these are the "5 Whys Approach," which focuses on recursive questioning to identify the root causes of failure rather than its superficial symptoms, and the Six Sigma Movement, which emphasizes consistency and reductions in process variance.[15]

[13] See Fishbein and Treverton, 2, for a succinct and useful discussion of "alternatives analysis."
[14] "Sensemaking" in this context means the ability to perceive, analyze, represent, visualize and make sense of one's environment and situation in a contextually appropriate manner. See both Fishbein and Treverton, 3, and Cooper, "*Sensemaking: Focusing on the Last Six Inches*."
[15] See the Six Sigma website, http://www.isixsigma.com/.

In the second category, such domains include the nuclear power industry, civil aviation, and aircraft carrier operations. These organizations recognize that routine operations can produce or face conditions that unexpectedly turn extraordinary, with serious, adverse consequences. The paradigm for organizations of this type is the High Reliability Organization (HRO) model.[16] Some commentators would also include hospitals, and especially their high-risk specialty units, as HROs because of the large consequences of error. Built-in practices—formal protocols, structured procedures, and self-awareness measures such as mortality and morbidity (M&M) conferences—are a sign that hospitals recognize the risks of errors.[17]

A common denominator of both categories of organizations is that they "…reliably forestall catastrophic outcomes through 'mindful' attention to ongoing operations."[18] As Fishbein and Treverton note, quoting Karl Weick and Kathleen Sutcliffe, "The unifying trait of HROs is that they exhibit the quality of 'mindfulness,' defined as:

> *…the combination of ongoing scrutiny of existing expectations, continuous refinement and differentiation of expectations based on new experiences, willingness and capability to invent new expectations that make sense of unprecedented events,…and identification of new dimensions of context that improve foresight and current functioning.*[19]

These organizations address the possibility of extraordinary events by building procedures that are designed to do more than maximize effectiveness and efficiency in the conduct of routine operations. The organization is focused on addressing *non-routine operations*, so that the unexpected "…doesn't surprise or disable them" and "…coping actions seldom make the situation worse."[20] These organizations see small errors in routine operations, in addition to their role as process signals, as indications that organizational compliance and managerial oversight are slipping—and that such slippage could presage worse failures.

Both categories of organization understand that successful day-to-day operations can give rise, in effect, to *mindlessness*, defined as inattention to the environment and to internal procedures. In these circumstances, people slip into routines, fail to notice changes in a larger context, see new phenomena in old categories, and use incoming information (even if it indicates significant variances) to confirm expectations. *Mindfulness*, on the other hand, emphasizes continuous updating and assessing alternate interpretations and implications of incoming information; even small signs of failure can suggest serious problems in organizational processes and compliance with them. In these organizations, according to Wieck and Sutcliffe, there is a "preoccupation with failure, both past and present"; and there is a concomitant stress on early error detection and cor-

Successful day-to-day operations can give rise to* mindlessness*, defined as inattention to the environment and to internal procedures.

Mindfulness*, on the other hand, emphasizes continuous updating and assessing of alternate interpretations and implications of incoming information.*

[16] A number of perceptive commentators have pointed to HRO as a useful model, although often for diverse reasons. See Sabel, Johnston, and Stephen Marrin in "Preventing Intelligence Failures by Learning from the Past," and Fishbein and Treverton.
[17] The continuing high rates of medical errors and the increasing appearance of "iatrogenic" (that is, physician-induced) diseases in hospitals suggest, however, that these organizations have a long way to go before they can be fully recognized as HROs.
[18] Karl E. Weick and Kathleen M. Sutcliffe, *Managing the Unexpected: Assuring High Performance in an Age of Uncertainty*, 23.
[19] Fishbein and Treverton, 4, quoting Weick and Sutcliffe, 25.
[20] Weick and Sutcliffe, 42.

rection at the lowest levels, as well as emphasis on error reporting upwards as part of the self-assessment "contract."[21]

Each category contains proven features that recommend themselves for inclusion in a new synthesis for a transformed intelligence analysis process.[22] ***From the High Reliability Organization,*** the feature is "mindfulness," which is composed of five processes (and sub-processes below them): anticipating and becoming aware of the unexpected; containing the unexpected; near-miss analysis; active management; and enhancing containment. The most important elements in creating an anticipatory capability are a reluctance to simplify interpretations, which increases blind spots by filtering and abstracting key details; recognizing the effect of categorization on expectations by continually reexamining categories and event coding; and reassessing the basic assumptions and keystones of one's analysis and analysis process. In addition, the stress on "near-miss analysis" is designed to recognize imperfections and errors before they cause consequential failures.

The process watcher function is intended to focus exclusively on identifying errors in the analytic process, not on alternative interpretations of the evidence or different logic chains.

> *Both [near-miss and line stoppages in a just-in-time system] trigger root-cause analysis meant to uncover not only the proximate cause of the incident, but to eliminate, through redesign of the organization if necessary, the background conditions which generated the immediate source of the danger.*[23]

From the Quality Movement, the synthesis model adopts the "5 Whys Approach," employing a recursive questioning process that emphasizes the importance of identifying root causes of errors. This involves looking beyond the obvious first answer to the "what went wrong" question to the serially deeper causes until the base source of error is found. ***From medicine***, there are two elements worth including. First is the practice of mortality and morbidity conferences, which focus on both near-miss and failure analysis. The second is the practice of "grand rounds" in which house staff, students, and attending physicians brief and review especially difficult cases. Both measures underscore the importance of open and collaborative communication in identifying and assessing hard problems, including both those that were resolved successfully and those that failed. Such open communication is essential to both investigatory and teaching roles. Finally, ***the introduction of a "process watcher,"*** as suggested by Kahneman, is intended to bring a clear and unbiased, outside expert's eye to analytic teams. The process watcher function, unlike that of a Red Team, is intended to focus exclusively on identifying errors in the analytic process, not on alternative interpretations of the evidence or different logic chains.

In light of the real challenges to conducting complex analysis effectively, it is important that the Intelligence Community identify and evaluate tools and methodologies that can help analysts make sense of complex phenomena rife with ambiguous or incomplete evidence—and then actually provide them. The revamped paradigm must also include processes that are more specifically directed toward strengthening the practice and content of analytic methods. This paradigm would very likely incorporate more widespread and routinized use of formalized techniques, such as Analysis of Com-

[21] Weick and Sutcliffe, quoted in Fishbein and Treverton.
[22] This study will develop a brief outline of such organizational characteristics, but a comprehensive treatment will require a separate paper.
[23] Sabel, 30.

peting Hypotheses (ACH), to explore multiple hypotheses and would employ appropriate supporting tools to facilitate their use.[24] There would also be more emphasis on the use of negative evidence and on its implications for key assumptions and inferences, especially when the orientation is toward current intelligence.[25] Finally, new collaborative mechanisms, such as "blogs" (web logs), "wikis" (wikipedia entries), and groupware could be employed to facilitate better communication and a more continuous dialogue among the parties within the community of interest.[26]

This new analytic paradigm is designed to lead analysts to reflect more intensively on the practice of their trade. It is also intended to develop more structured procedures and to instill in both individual analysts and analytic units the discipline to follow them. Such changes will need to be implemented carefully, so as not to interfere with individual creative processes and existing analytic practices that are effective, especially those that are unorthodox and not easy to assess with formalized metrics. It will be especially important to guard against the danger that too much introspection will cause analysts to avoid risk by dodging judgments.

Recruiting, Training, Educating, and Developing Professionals

In the wake of 9/11, the Intelligence Community has been able to take advantage of an upwelling of public support to tap a large pool of candidate analysts. These candidates are, on the surface, talented, diverse, and well educated; but they will require extensive training and professionalization in order to become effective and productive contributors to the analytic community. Furthermore, in current circumstances, when analysts should more frequently be addressing the challenge of "discovery" and open-ended, undefined problems than more readily defined monitoring tasks, they are confronted by time pressures that leave them with little latitude for reflection and wondering. Moreover, our educational system increasingly produces linear thinkers more comfortable "painting within the lines" and pointed more toward likely solutions than toward broader problem-solving capabilities.[27] It is unclear if these shortcomings can be corrected by better-targeted recruitment and more effective training, or if it must be addressed by redesigning fundamental processes and practices; it is likely that both tracks will be needed.

However the question of academic preparation is resolved, rebuilding the apprenticeship and mentoring system is crucial. It is essential, therefore, to reconstitute the "keystone species" represented by the journeyman analyst.[28] This cannot be done by bringing in a flood of young, inexperienced analysts; dousing them with a short period of classroom training (begrudged by their managers and mostly focused on the right tone and format for reports); and leaving them to learn good practices while sifting for nuggets of current intelligence.

There is no known mechanism that can turn the apprentices into "instant" journeymen; they cannot be transformed by lectures,

[24] An example is the ACH Tool developed by Palo Alto Research Center (PARC) for the Novel Intelligence from Massive Data (NIMD) Program under the Intelligence Community's Advanced Research and Development Activity (ARDA).
[25] Kerr, et al.
[26] See Calvin Andrus's Galileo Award winning paper, "Toward a Complex Adaptive Intelligence Community," in *Studies in Intelligence* 49, no. 3 (2005).
[27] As Daniel Goleman noted in his answer to the "2005 *Edge* Question," an annual survey by *The Edge*, an internet site favored by the technical community.
[28] Additional incentives to retain these experts appear worth considering.

As an Intelligence Analyst's Rite of Passage Might Look

As the Stefiks made admirably clear in their book about innovation:

> *Graduate school is a rite of passage for becoming researchers and inventors. Graduate schools create the next generation of researchers and inventors who are primed to step into positions in the world of science and innovation.*
>
> *The experience of graduate school draws on a much earlier tradition than undergraduate education, or even high school and grammar school. Education prior to graduate school is dominated by a program of lectures, exercises and exams. Such educational practices have a predetermined curriculum intended to serve classes of students essentially in lock step….*
>
> *In contrast, graduate school is based on the older tradition of mentoring and apprenticeship. Graduate education is about assisting students to take on a professional practice. The curriculum is more tailored. Students acquire the practice by working with multiple mentors, adjusting the emphasis to fit their career objectives. Students discover, sometimes by osmosis, elements of practice that would seldom be encountered in a classroom setting. Graduation requires demonstrated mastery at the level of a practitioner in the field.*[1]

[1] Stefik and Stefik, 85.

abstract study, or classroom exercises; nor can software tools enable them to substitute for more experienced analysts.[29] This challenging task demands a focused, directed effort at deep analysis within a subject area, most likely through a tutoring and apprenticeship model.[30] In addition, revised classroom instruction, based on a significantly strengthened curriculum emphasizing analytic methodologies and methods, could have an important role within a rebuilt program for professional development. The Intelligence Community should move away from "training courses" that take analysts off-line for weeks to months and reintegrate this type of training directly into the "practice" of intelligence analysis, as is done in clinical education for medicine and law. Moreover, it is absolutely essential to create a professional "duty of curiosity," which the training process would embed in the professional ethos and management would encourage, even in the face of time pressures to meet priority taskings. Further, a peripatetic career for senior analysts—"moving around to move up," often increasingly farther from the actual practice of analysis—is not a useful way to foster deep expertise or to create effective role models. Reestablishing a new cadre of effective professional intelligence analysts will require basic changes in their career patterns, potentially requiring that the military practice of tracking and protecting vital sub-specialties with their own career ladders be emulated.

These factors prompt the thrust to restructure the career path of intelligence analysts, perhaps along the lines of medical or science graduate education—especially doctoral and post-doctoral—that integrates classroom learning, research, and clinical practice. In neither case are education and training separated; each is seen as an integral element in producing a practicing member of the medical or scientific community. In this context, then, deeper analytical products are essential to building the process expertise and domain knowledge of the analyst and to rebuilding the domain knowledge base. Together, these capabilities enable a skilled analyst to contextualize current intelligence for the decisionmaker.

Such a restructured program should also seek to foster an open seminar atmosphere during the training process and impart to analysts the practice of critical collaborative discussion within a professional network

[29] Frank J. Hughes, *Preparing for the Future of Intelligence Analysis*.
[30] Hughes, 2–3

carried directly into the workplace. Moreover, in this process, in which socialization is seen as an important aspect of absorbing the ethics and ethos that should guide a professional, a close relationship with a mentor is crucial. The mentorship process also reinforces the HRO's emphasis on a "culture of learning," a habit of error reporting developed by encouraging openness, tolerance of even "stupid questions," and professional collaboration as a norm.

The drastic shortages in the cadre of experienced analysts prompt three final thoughts on this process. First, the Intelligence Community must bring back sufficient mentors (even if on contracts that permit double-dipping), so that it can truly support the apprenticeship model with highly personalized mentoring. This will not be an easy task; mentors will need to be chosen carefully and supervised properly, so that the right lessons from experience are passed on—not cynical views carried away from previous experience with a dysfunctional process. Second, the community also needs to give up the conceit that it can develop software and tools that will make the novices into journeymen or experts without their going through this lengthy process of apprenticeship. This is not to say, however, that appropriate tools either do not exist or cannnot be developed to help them do their jobs better and perhaps progress through the cycle more quickly. Third, and perhaps most important in the interim, the Intelligence Community should look for alternative ways to produce the intelligence insights that the journeymen used to provide while, at the same time, reestablishing the vital interrelated processes that created and fostered the development of "intellectual middleware." During this effort, managers must avoid the temptation to use these mentors to supplement the analytic cadre or to force the apprentices to rush their "analytical" fences.

About Apprenticeships

There is often a gap between what can be learned in formal lessons and what needs to be conveyed in total.…

When graduate students begin working with their mentors, they are embarking on a journey with an experienced guide. Apprenticeship amounts to going around the research cycle a few times, asking questions, and getting help at the trickier steps.[1]

[1] Stefik and Stefik, 86.

User-Community Interactions

The current processes for interaction between the Intelligence Community and its consumers, especially senior policymakers, do not work well at either end of the "Intelligence Cycle." The community does a less than satisfactory job of communicating its judgments to these customers.[31] At the same time, few users have any real education or understanding of the Intelligence Community's capabilities and limitations. To a large degree, both problems can be ascribed to too little sustained dialogue, interaction, engagement, or mutual understanding; both parties fail to understand that they are in a collective process of discovery, sensemaking, and judgment. These failings have not come about by accident, however, but by community preference. They flow from what have been deeply rooted beliefs—especially strong at CIA—that too close an association with policymakers and their political concerns runs the danger of contaminating "pristine" intelligence analyses with "policy judgments."[32] As noted ear-

[31] The term "Intelligence Cycle" is itself part of the problem. With its Industrial Age antecedents, it usually conveys the notion of a self-contained "batch" process rather than a continuous spiral of interactions.

lier, maintaining an appropriate degree of objectivity is a difficult problem; but a good solution is to be found neither by substituting users' judgments for those of intelligence professionals nor by the professionals ignoring users' real interests and needs.

Since the collapse of the Soviet Union, this mutual lack of understanding, combined with the lack of a sustained strategic policy that would provide consistent guidance and priorities, has forced the Intelligence Community to divine targets and priorities from immediate customer requirements rather than from a longer time horizon with a more strategic, synoptic, and open-minded field of view. Moreover, this tendency was reinforced throughout most of the 1990s by budget pressures that drove the community to focus on issues "relevant" to senior policymakers —and, therefore, defensible in budget hearings. Unfortunately, this approach guarantees myopia, and the Intelligence Community winds up bearing the blame for "failures" to see threats from outside the policymakers' fields-of-vision.

Analysts and their managers should be prepared to be forthright in admitting what they don't know and in identifying explicitly the uncertainties in judgments they provide.

The current "over-the-transom" process for taskings and questions often leaves the working analyst without a good understanding of the real issues at stake or the purposes to which customers will put the answers once delivered. Yet, both are important if uncertainties and sources are to be addressed in a context that the policymaker can appreciate. When the Intelligence Community provides its analyses and judgments, too much emphasis is given to the format in which the information is presented, and there is too little real dialogue with the users. The layout—too frequently formal, precisely-formatted, sterile "finished products"—often masks uncertainties and points of contention unless the reader is witting enough to "pull the threads," an effort that can lead to charges of politicization.

The community should move away from the notion that "finished intelligence" conveys certainty; highlighting and clarifying disagreements, especially over fundamental assumptions and judgments, would be of more value to high-level policymakers.[33] At the same time, the false expectations conveyed by the "conceit of finished intelligence" and the "illusion of omniscience" must be changed on both sides. Users must learn that there may not be a "right" answer; that the "more probable" case in the forecast set may not be the situation that will eventuate; and that, therefore, a range of thoughtful (and thought through) contingency responses may be necessary.

Equally, analysts and their managers should be prepared to be forthright in admitting what they don't know and in identifying explicitly the uncertainties in judgments they provide. This means providing greater transparency and traceability as they construct inference chains based on explicitly denoted qualified evidence, other information, assumptions, and hypotheses.[34] Analysts must themselves remember and remind policymakers of Heisenberg's rule: that we are not simply outside observers of a process who have no effect on the outcome; our perceptions and actions are integral elements in a multiplayer game with strongly coupled feedback loops and action-reaction cycles.[35] Finally, it must be recognized that the frequent lack of deep understanding of intelligence on the part of its primary policy users suggests that a serious education effort needs to be undertaken.

[32] See Davis, "Kent-Kendall Debate."
[33] See Kerr, et al. on "Integration with the Policy Community," 52.
[34] This has important and challenging implications for the estimative methods used by a community self-defined as "evidence-based."
[35] German mathematician Werner Heisenberg (1901-1976). I am indebted to John Bodnar for highlighting this issue.

Members of other communities—the strategic nuclear community may be the best example—deal with arcane subjects that must be communicated clearly to national decisionmakers who often lack experience or expertise in such matters. They have addressed this problem by developing formal procedures for educating their users and managing their expectations.

Unfortunately, if all the policymakers see is a continuous flow of "current information" while lacking deep knowledge of a topic or the time to synthesize and integrate what they do learn into a coherent picture, an Intelligence Community version of Gresham's law may well apply—factoids devoid of context will drive out thinking. This situation has implications not only for management of the technical systems that support and encourage collaboration and sharing, but also for the important social aspects of group behavior and the mechanisms for interaction between policy users and the analysts. It has significant implications both for the roles intelligence analysts will play and for the modalities through which they produce and communicate their analyses to users.

Communicating complex judgments and degrees of confidence in those judgments is best done through conversation among the parties, which demands different mechanisms than simple dissemination of "facts." If the mechanisms for interaction with the users of intelligence are designed only to support the provision of individual pieces of evidence rather than to engage both parties in an extended conversation in which ambiguity and subtlety can be communicated, it is unlikely that either party will be satisfied with these interactions. Indeed, it is worth asking whether the Intelligence Community has any unique contributions to make to anticipatory judgments compared with what policymakers can provide themselves, and, if so, what are they? Posing the question this way emphasizes that such anticipatory assessments are in the realm of judgment, an area that the community, in its quest for "rigor," has often tried to avoid. Now, given the variety of alternative information sources available to the policymaker, is even superb "current reporting" enough to make the community essential, especially to the policy users?

"Proof," Validation, and Review

The community needs to create processes that capture the best of the legal system's adversarial model and the scientific community's horizontal peer review.

Failures in the pre-war estimates concerning Iraq's WMD capabilities highlight deep-seated problems in the extremely "self-referential"—that is, customarily internal, collegial, and lacking rigor—process for reviewing and validating intelligence judgments. At the same time, there is absolutely no excuse for allowing easily correctable errors, such as "Key Judgments" that differ from the body of the text or references to earlier assessments that portray their judgments inaccurately, to be conveyed to consumers.[36] The existing process relies fundamentally on an analyst-level coordination process augmented by a hierarchical review process, most often by managers who possess less specific knowledge and are farther removed from the craft of analysis. The community needs to create new processes that capture the best of the legal system's adversarial model of open combat and the scientific community's truly horizontal peer review and independent replication, sprinkling in alternative analyses and red teams to do so on both process and substance.

Such processes, even if conducted totally inside the community, are bound to be distressing, as knowledgeable individuals subject an analyst's evidence, assumptions,

[36] See *SSCI Report*, 286 and 300.

hypotheses, and logic to increased scrutiny. These mechanisms, including workshops and roundtables, would be useful; but if they are composed solely of Intelligence Community members, or those who defer to them, then the problem of a self-referential "proof process" will continue. Therefore, painful as it might prove to be, the Intelligence Community must step outside its usual circle and exploit a wider range of expertise.

To understand "what works" and "what doesn't work," the Intelligence Community should establish an institutional "lessons-learned" process.

In addition to peer review, the scientific community has fostered a range of self-correcting features, such as tension between experimentalists and theoreticians. It also relies on a wider range of alternative proof models. Such additional mechanisms for validation should be examined for incorporation in the revamped intelligence analysis process. Furthermore, as in medicine, law, and science, mechanisms need to be developed and implemented to ensure that knowledge bases are updated and corrected as necessary and that users are notified of major errors in previous reports, so that the cumulative knowledge base is as accurate as possible.[37]

Finally, both the Intelligence Community and its users must have an accurate calibration of whether intelligence is "on top" of important issues and domains. The review process must go beyond assessments of individual products and personnel performance to create processes that assess the "state of knowledge" and the community's (and its users') awareness of that state. This type of self-diagnosis is badly needed, especially as it creates an environment for self-criticism combined with a license to look at the adequacy of information both on specific issues and across wide domain areas.

After-Action Reports and Lessons-Learned Processes

Unlike medicine or law, militaries do not usually have the luxury of a continuous stream of real opportunities to "practice" their craft or profession. To address these problems, the US military counts on intensive individual and unit training, institutionalized after-action reports and lessons-learned processes, and the exercise of complete operational organizations before units participate in actual operations. It also instantiates understanding of what works best as formal "doctrine" that can be studied and inculcated to provide a common frame of reference and instinctive procedural basis. One can find very similar systems created in both academia and medicine to educate and train their incoming members. In these other professions, there is little distinction or separation between education, research, and training; rather, there is a continuum of learning that depends heavily on the "hands-on" transmission of domain knowledge and process expertise.

In order to understand both "what works" and "what doesn't work," the Intelligence Community should establish an institutionalized lessons-learned process. This would include not only postmortems on major failures but also on successes and near misses.[38] The purpose of this process is not to assign blame, which is traditionally an inspector general function, nor is it to punish; rather, it should serve as an aid to individual and organizational learning. Both after action reports, developed originally at the US Army's National Training Center (NTC), and lessons-learned processes, used by the Army and the US Joint Forces Command (JFCOM), are effective methods and would be good starting points for creat-

[37] This problem is significantly aggravated by the lack of a coherent information infrastructure.
[38] This is very much like Klein's "premortems," cited in Fishbein and Treverton, 7. See also Gary Klein, *Intuition at Work: Why Developing Your Gut Instinct Will Make You Better at What You Do*, 88.

ing an Intelligence Community effort. A good complement to the lessons-learned process is the use of wargaming and scenario methods, developed on an accurate historical basis, to force the participants to examine the situation, the players, their interactions, and the outcomes in a thoughtful manner.

After action reports and lessons-learned processes can also furnish objective evidence of the utility of tools and methodologies and their suitability for addressing various kinds of problems. Without such a measured baseline of effective procedures, methods, and tools, it is difficult to create consistent processes to select and adopt appropriate analytic methodologies or to train and exercise personnel. In addition, a baseline makes credit assignment and personnel efficiency reviews more reliable. As another former analyst and thoughtful observer of the analytic process has written,

> *The identification of causes of past failure leads to kernels of wisdom in the form of process modifications that could make the intelligence product more useful. A more effective, more accurate intelligence capability may still be vulnerable to the cognitive and institutional pathologies that cause failure, but a self-conscious and rigorous program based on the lessons derived from the existing literature would strengthen the intelligence product.*[39]

Key Questions in Reviewing Lessons Learned

Veteran analyst Charles Allen provides a list of questions that a lessons-learned process can assist in answering:

- What set of hypotheses was being considered? Was the set comprehensive, or was there bias in the selection of hypotheses? What *a priori* probability was attached to each hypothesis? Again, was there bias?
- Was there a good understanding about the observables that were expected to differentiate between the hypotheses? Was intelligence collection requested on the basis of these differentially diagnostic observables?
- Were all the available data considered? How were the data weighted? What degree of credibility was accorded the sources?
- Was the possibility of deception considered and accounted for?
- Was the analytic process logically correct? Was the confidence in rendered judgments correctly estimated? If so, and if the confidence was low, was additional collection requested?
- Were the judgments presented in a timely and adequate manner?
- And, of course, was intelligence collection responsive and timely?[1]

[1] Allen, 3–4

Collaboration

Several of the recent investigations point to the important role in these intelligence failures of lapses in sharing information and coordinating efforts among the constituent elements of the Intelligence Community. Not surprisingly, the suggested remedies often involve establishing new directive authorities to mandate coordination and collaboration and build or improve the technical information infrastructures that could support collaborative activities. In fact, solutions do not start with either directive authorities or new IT systems, although an improved, technically sophisticated information infra-

[39] Stephen Marrin, "Preventing Intelligence Failures by Learning from the Past," *International Journal of Intelligence and Counterintelligence*, 2004. A recent conference on lessons learned, sponsored by the Center for the Study of Intelligence, discussed this question at some length and provides an excellent point-of-departure for implementation projects. See *Intelligence Lessons Learned Conference*.

structure would help. Rather, effective collaboration is fundamentally a matter of culture and values; what is needed is, first, to create appropriate incentive structures for sharing and, second, to forge expert social networks and effective "distributed trust" systems. These are problems of organizational culture that demand active leadership at all levels of management throughout the community.

Sharing of private information among experts is task for which technical solutions exist, but the community's technical, organizational, cultural, and incentive structures fail to support it.

Moreover, as mentioned previously, the success of the Intelligence Community depends on the promotion of an entire set of effective collaborations: among analysts; between analysts and collectors; between analysts and operations officers; between analysts and the intelligence users; and not least, between community analysts and information sources outside the intelligence or national security enterprise. For example, tasks such as target assessment and collection planning involve complex collaborative activity among analysts and collectors. Often there are subtle bits of information that appear significant only in the context of tidbits from other disciplines or aspects of tradecraft which may be little understood—or not at all—outside the ranks of its own practitioners. Each of these collaborations involves a distinct "community of interest" or "community of practice" and represents a different type of social construct; none is fundamentally dependent on building more elaborate technical infrastructures as its primary need. Fostering effective collaborations can serve an important bootstrapping function as well, because participants in the collaboration are likely to become effective champions of more collaboration.

Furthermore, true collaboration within the Intelligence Community should address more than simply sharing raw intelligence among different analytic components or taking part in the coordination process for finished products. The Intelligence Community understands how to do these tasks, even if they are not implemented effectively today. The real challenge and greatest leverage will come from sharing private information, initial hypotheses and tacit knowledge, among networks of experts in order to increase the opportunities for discovery of previously unrecognized significance. This is a task for which technical solutions are now known and feasible, but the community's technical, organizational, cultural, and incentive structures fail to support it. A true collaborative environment must build effective trust systems among community analysts and collectors, especially between the DI and the DO. Indeed, such trusted environments should extend beyond the Intelligence Community to policymakers and, eventually, to other sources of expertise outside of the community and even outside the United States.

Another important reason for fostering collaboration is that of reducing information costs. Such reductions can result not only from the powerful impacts of information technologies on organizational forms, but also from the role of "social networks" as a medium for sharing among trusted members. Such networks, especially those among journeymen analysts, substantially reduce the transaction costs of creating and transmitting knowledge; in particular, they are a low-cost information resource for the essential tacit knowledge, both domain and process, that is so difficult to elicit and instantiate in formal knowledge systems. Moreover, because of the wide-ranging social network that journeymen build over their years of service, these networks can both help to diffuse account-specific insights into other areas and infuse other perspectives into their domain, often cutting across formal community security compartmentation restrictions. As with many examples of military C2, it is these informal networks and processes that truly enable the system to function. The potential of using "groupware," such as Groove and

other collaboration platforms, in building and strengthening these social networks bears careful exploration and experimentation.[40]

Finally, the Intelligence Community's security mindset should also be addressed. The overall approach to security—mandated from the top by the newly created DNI if it is to have sufficient weight to become the new paradigm—must move away from the existing risk-averse model, which really seeks to avoid problems. Despite the likelihood of significant opportunity costs, the direction must be toward a risk management model like that increasingly being adopted for information security in other government agencies and the private sector. One approach would take responsibility for personnel and IT security out of the hands of dozens of individual agencies and make them the responsibility of a single community manager who would also have the power to adjudicate equities and make risk management decisions.[41] A single authority under the new DNI would issue security clearances and set security requirements for IT that would apply throughout the federal government (or at least the executive branch), among government contractors, and, ideally, to state and local government agencies, as required. This system would also eliminate the need to have clearances passed, making expedient collaboration easier. Uniform security standards for IT systems could make the electronic sharing of information and on-line collaboration among analysts substantially easier, thereby enabling the formation of collaborative "communities of interest" within a secure information environment.

[40] Groove is a software package that creates a virtual private network (VPN) within an information network that controls access to a shared collaborative space and provides a variety of tools to facilitate information sharing and collaboration. It is accepted by some components of the Intelligence Community as secure and trustworthy, but it is not widely employed at this time.

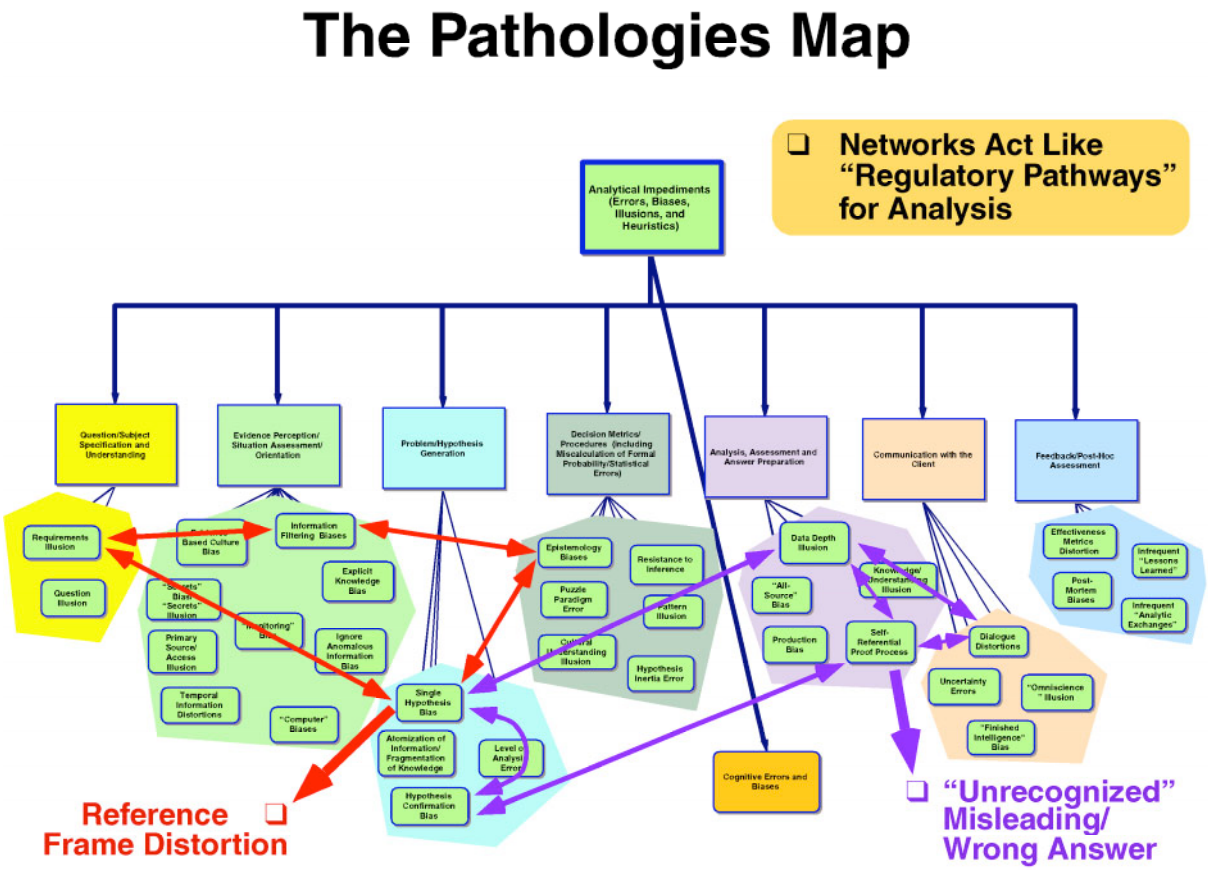
[41] The IRTPA, creating the Information Sharing Executive Program Manager, does mandate this, at least for counterterrorism information.

Appendix:
The Analytic Pathologies Methodology

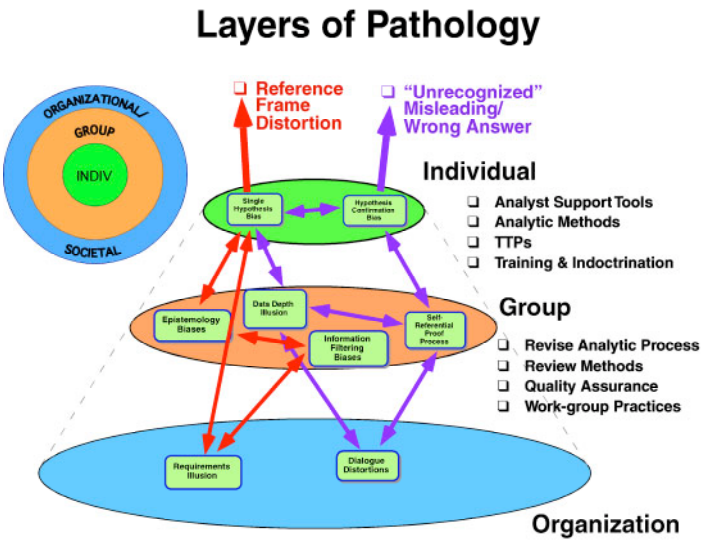
The “Analytic Pathologies” methodology expands the typical portrayal of the five-part intelligence cycle (planning and direction, collection, processing, analysis and production, and dissemination) to include seven elements in the analytic process:

- question specification and subject understanding
- evidence acquisition and situation perception/assessment
- problem/hypothesis specification
- decision metrics and procedures
- analysis, assessment, and answer preparation
- communication with the client
- feedback and post-hoc assessment.

More consistent with current research on judgment and decisionmaking, this expansion permits a closer look at the analytic process itself. This approach also makes it possible to capture explicitly the important calibration functions of interactions with cli-



Graphic courtesy of SAIC



Graphic courtesy of SAIC

ents in framing questions and in delivering answers, and it highlights the importance of explicit feedback for self-assessment. In this approach it is also possible to identify more completely the impediments to analysis and to specify the location and distorting effects of each step in the process.

Finally, the methodology explicitly lays out the key processes and functions (as well as impediments) at three organizational levels: individual analysts, work groups and agencies, and the Intelligence Community as a whole. This layout enables investigators to examine the causes of analytic problems and locate their organizational sources; these problems can occur not only where they directly interfere with the analytic process, but also in the functions which support agency and community analytical processes. With that information, appropriate corrective measures can be identified more easily.

Thus, although the Intelligence Community organizational level provides direction, priorities, and controls budgetary resources—which are important support mechanisms and enablers of output functions—it does not itself directly perform any intelligence functions, except analyses conducted by the National Intelligence Council (NIC), now a part of the office of the Director of National Intelligence.

The effectiveness of the Analytic Pathologies methodology as a diagnostic tool suggests its potential utility when used as a framework for developing corrective measures. The diagnostic effort highlights the importance of properly identifying the organizational level at which impediments impinge upon successful analytic practice, as well as the level at which corrective actions must be taken to restore important functions—and these are often not the same. For example, there are a substantial number of impediments to effective performance by individual analysts, but the appropriate corrective measures need to be instituted at the group or organizational level instead of the analytical level. Different corrective measures also have different time constants of effectiveness to be accommodated, both in planning and in measuring improvement; otherwise, phasing conflicts could easily induce resonant oscillation in processes and control mechanisms.

The explicit differentiation among these elements allowed by this methodology can enable individual and organizations at all levels to develop tools to recognize and use pathology self-assessments. It also allows the development of appropriate measures of effectiveness or indicators of performance targeted at relevant outputs rather than inputs. Thus, extending the Analytic Pathologies framework to use as the basis for developing corrective measures offers promise that it may be able to identify and, therefore, avoid perverse consequences that might result from altering structures and processes while attempting to make them more effective.

IC Functions and Outputs at Three Levels

Level	Key Functions	Outputs
Intelligence Community	• Direction and Leadership • Setting Priorities • Budgetary Control	• Policies • Oversight • Budgetary Allocation
Work Group/Agency	• Training and Acculturation • Work Practices and Habits (TTPs) • Rewards and Incentives • Review Processes • Organizational Knowledge Base	• Review • Production • Dissemination • Customer Interfaces • Work Processes • Technical Infrastructure • Organizational Culture
Individual	• Analytic Expertise • Domain Knowledge	• Answers • Hypotheses • Knowledge Products • Increased Knowledge • On-demand Expertise

The Author

Jeffrey R. Cooper is Vice President for Technology, Chief Scientist of Strategies, and Director of the Center for Information Strategy and Policy at Science Applications International Corporation. He has undergraduate and graduate degrees from The Johns Hopkins University, where he was later Professorial Lecturer in Arms Control and Defense Analysis at the School of Advanced International Studies.

Mr. Cooper's core interest has been the use of information to improve intelligence analysis, decisionmaking, command and control, and operational effectiveness. During the past several years, Mr. Cooper has focused on analyzing intelligence failure and evaluating methods to improve all-source analysis. He was a professional staff member of the Presidential Commission on Future Intelligence Capabilities (The Silberman-Robb Commission).

With a long-time focus on strategic analysis and military transformation, Mr. Cooper is a founding member of the Highlands Forum, a program sponsored by the Secretary of Defense to identify national security-related cutting-edge technology. He has also served on numerous Defense Science Board task forces and summer studies. He has held senior government positions in the White House and the Department of Energy.

"This study is fundamentally about what I would call the intellectual professionalization of intelligence analysis. It is about standards and practices and habits of mind. It is about inductive (evidence-based) analytical reasoning balanced against deductive (hypothesis-based and evidence-tested) reasoning. It extols the value of truly scientific modes of thinking, including respect for the role of imagination and intuition, while warning against the pitfalls of "scientism," a false pretense to scientific standards or a scientific pose without a scientific performance. It talks about peer review and challenging assumptions and the need to build these therapeutic virtues into the analytical process."

Fritz Ermarth
Chairman of the National Intelligence Council, 1988-93

DEFENSE AND INTELLIGENCE ABBREVIATIONS AND ACRONYMS

Foreword

This comprehensive list of intelligence abbreviations and acronyms includes those used presently, as well as those in use for approximately the last ten years. Sources for this list include the last DIA Lexicon published in 1991, numerous glossaries from Unified Command and Combat Support Agency documents, and contributions, from the faculty of the Joint Military Intelligence College. The expansion of any item may vary somewhat from one organization to another, but this list will hopefully contribute to greater standardization.

This editor is indebted to kSgt Hannah Reddy (USA) and SSgt Angela Wimbush (USAF) of the College, who spent many hours in collating this list. Debbie Linesberry of the U.S. Special Operations Command collaborated by adding that command's most frequently used acronyms. 2LT Vincent Littrell (USAF) and SFC Mark McCurry (USA) helped ensure that the list contains as few errors as possible, and the editor extends his thanks for that dedicated assistance.

All users are invited to submit additions and corrections. To promote the usefulness of the list, older or superseded acronyms will be discarded only if their retention would create confusion. This list is also published under the JMIC home page on Intelink, where it will be updated regularly. Readers are urged to send new acronyms or abbreviations by mail to: Defense Intelligence Agency, Joint Military Intelligence College, MC Attn: Dr. R. Swenson, Bolling AFB, Washington, DC 20340-5100: by Ingternet to AFswerg@dia.osis.gov, or by Fax to (202) 231-2171.

Dr. Russell G. Swenson, Editor and Director, Office of Applied Research

ABBREVIATIONS AND ACRONYMS

A

A2	Air Force Intelligence Staff Officer (component level)
AA	(1) Attack Assessment; (2) Attrition Analysis; (3) Antiaircraft; (4) Avenue of Approach; (5) Automatic Associator
AAA	(1) Antiaircraft Artillery; (2) Air Avenue of Approach
AAAOB	Antiaircraft Artillery Order of Battle
AABNCP	Advanced Airborne National Command Post
AAC	Alaskan Air Command
AACB	Aeronautics and Astronautics Coordinating Board
AACE	Army Alternate Command and Control Element
AACOMS	Army Area Communications System
AACS	Attitude and Antenna Control Subsystem
AAD	Airborne Assault Division
AADC	(1) Army Air Defense Command; (2) Area Air Defense Commander
AADCCS	Area Air Defense Command and Control System
AADP	Area Air Defense Plan
AADS	Antiaircraft Defense System
AAE	Army Acquisition Executive
AAF	Army Airfield
AAFES	Army & Air Force Exchange Service
AAFIF	Automated Air Facilities Information File
AAG	Army Artillery Group
AAI	Air-to-Air Intercept
AAIFF	Air-to-Air Identification Friend or Foe
AAM	Air-to-Air Missile
AAO	Analysis of the Area of Operations
AAR	(1) Active Array Radar; (2) After Action Report
AAS	Analyst Automation Segment
AASLT	Air Assault
AATS	Automated Architecture Tool Suite
AAVS	Aerospace Audiovisual Service
AAW	Anti Air Warfare
AAWC	Anti Air Warfare Commander
AB	Air Base
AB2	Air Battle Command System (ABCS) Brigade and Below
ABC	Airborne Corps
ABCCC	Airborne Battlefield Command and Control Center
ABCOMM	Alternate/Backup Communications

ABCS	Army Battle Command System
ABIC	Army Battlefield Interface Concept
ABIT	(1) Airborne Imagery Transmission; (2) Airborne Information Transmission Program
ABM	(1) Antiballistic Missile; (2) Automatic Building Machines
ABMA	Army Ballistic Missile Agency
ABN/Abn	Airborne
ABNCP	(1) Airborne Command Post; (2) Airborne National Command Post
ABR	Available Bit Rate
ABW	Air Base Wing
AC	(1) Air Crew; (2) Active Component; (3) Air Conditioning; (4) Alternating Current
A/C	Aircraft
A2C2	Army Airspace Communications and Control
AC-130	AFSOF Spectre Gunship
AC2SMAN	Alaskan Command and Control System Military Automated Network
AC2MP	Army Command and Control Master Plan
ACA	(1) Alternate Command Authority; (2) Airspace Control Authority
ACAAM	Air Courses of Action Assessment Model
ACACS	Army Command and Area Communications System
ACAT	Acquisition Category
ACC	(1) Access Control Center; (2) Air Control Center; (3) Aviation Component Commander, (4) Air Component Commander, (5) Air Combat Command; (6) Army Component Command
ACCB	Army Configuration Control Board
ACCHAN	Allied Command Channel
ACCIS	Allied Command and Control Information System
ACCISS	(1) Automated Command and Control Intelligence Support System; (2) Alaskan C2 Intelligence Support System
ACCO	Army Central Control Office
ACCS	(1) Airborne Command and Control Squadron; (2) Airborne Command and Control System; (3) Advanced Communications Control System
ACDA	Arms Control and Disarmament Agency
ACDS	Advanced Combat Direction system
ACDUTRA	Active Duty Training
ACE	(1) Allied Command, Europe; (2) Advance Communications Element; (3) Aviation Combat Element; (4) Analysis Control Element; (5) Assistant Corps of Engineers; (6) Airborne Command Element
ACES	Automated Command and Control Evaluation System
ACEVAL	Air Combat Evaluation
ACF	Alternate Command Facility
ACFT	Aircraft
ACI	Airborne Controlled Intercept

ACINT	Acoustic Intelligence
ACIS	Arms Control Intelligence Staff
ACL	Access Control List
ACLANT	Allied Commander Atlantic
ACO	(1) Access Control Officer; (2) Airspace Control Officer
ACOC	(1) Area Communications Operations Center; (2) Air Combat Operations Center
ACOM	Atlantic Command
ACOS	Assistant Chief of Staff
ACOS/I	Assistant Chief of Staff for Intelligence (Navy)
ACOUSTINT	Acoustical Intelligence
ACP	(1) Alternate Command Post; (2) Assault CP; (3) Allied Communications Publications; (4) Airspace Control Plan
ACPERS	Army Civilian Personnel System
ACQ	Acquisition
ACR	(1) Armored Cavalry Regiment; (2) Automated Change Recognition
ACS	(1) Afloat Correlation System; (2) Aerial Common Sensor; (3) AUTODIN Switching Center; (4) Airborne COMINT System; (5) Assistant Chief of Staff
ACS/I	Assistant Chief of Staff for Intelligence
ACSA	Allied Communications Security Agency
ACSB	Amphibious Contingency Support Briefs
ACSC	Air Command and Staff College
ACSI	Assistant Chief of Staff Intelligence, HQ USAF
ACT	(1) Air Combat Tactics; (2) Advanced Concepts and Technology Program
ACTD	Advanced Concept Technology Demonstration
ACTEDS	Army Civilian Training, Education, & Development System
ACTS	(1) Advanced Communications Technology; (2) Advanced Communications Technology Satellite
ACUS	(1) Area Common User Systems; (2) Army Common User System
ACV	(1) Armored Command Vehicle; (2) Air Cushion Vehicle; (3) Armored Combat Vehicle
ACW	(1) Aircraft Control and Warning; (2) Anticarrier Warfare; (3) Air Control Wing
AD	(1) Air Defense; (2) Destroyer Tender; (3) Air Division; (4) Artillery Division; (5) Active Duty
A/D	Analog/Digital
ADA	Air Defense Artillery
ADACP	Alcohol & Drug Abuse Control Program
ADAPCP	Alcohol & Drug Abuse Prevention & Control Program
ADAPT	Automated Decisionmaking and Program Timeline
ADARS	Army Defense Acquisition Regulation Supplement
ADATS	Air Defense Antitank System
ADBT	Advanced Data Base Technology

ADC	(1) Aide-de-Camp; (2) Air Direction Center; (3) Assistant Division Commander; (4) Air Data Computer; (5) Air Defense Coordinator
ADCAP	Advanced Capability
ADCC	Air Defense Command Center
ADCCP	Advanced Data Communications Control Procedures
ADCOM	(1) Aerospace Defense Command (now SPACECOM); (2) Administrative Command
ADCON	Administrative Control
ADCSOPS	Assistant Deputy Chief of Staff for Operations and Plans
ADD	(1) Air Defense District; (2) Assistant Deputy Director (DIA)
ADDIS	Advanced Deployable Digital Imagery System
ADDISS	Advanced Deployable Digital Imagery Support System
ADDO	Associate Deputy Director of Operations
ADDO(MA)	Associate Deputy Director of Operations for Military Affairs (DIA)
ADDO(MS)	Associate Deputy Director of Operations for Military Support (NSA)
ADDS	Army Data Distribution System
ADDU	Additional Duty
ADE	(1) Audio Deception Emitter; (2) Aerial Delivery Equipment
ADEW	Airborne Directed Energy Weapons
ADF	Automatic Direction Finding
ADFH	Air Deployable Forward Headquarters
ADG	Deperming Ship
ADI	Air Defense Initiative
ADIC	Aerospace Defense Intelligence Center
ADIEC	Army Deployable Imagery Exploitation Capability
ADIO	Additional Duty Intelligence Officer
ADISS	Advanced Defense Intelligence Support System
ADIZ	Air Defense Identification Zone
ADL	(1) Ada Design Language; (2) Armistice Demarcation Line
ADLP	Advanced Datalink Protocol
ADM	(1) Atomic Demolition Munitions; (2) Advanced Development Model; (3) Acquisition Decision Memorandum
Admin	Administration/Administrative
ADN	ACE DGZ Number (NATO)
ADNET	Antidrug Network
ADOC	Air Defense Operations Center
ADP	(1) Automated Data Processing; (2) Airborne Data Processing
ADP-MIS	Automated Data Processing Management Information System

ADP-T	(1) Automated Data Processing and Associated Telecommunications; (2) Automated Data Processing and Associated Training
ADPCM	Adaptive Differential Pulse-Code Modulation
ADPE	Automated Data Processing Equipment
ADPS	(1) ASARS Deployable Processing Station; (2) Automated Data Processing System
ADPSSM	Automated Data Processing Systems Security Manual
ADPSSO	ADP Special Security Officer
ADPSSP	Automated Data Processing System Security Program
ADRG	Advanced Digitized Raster Graphics
ADRI	Arc Digital Raster Imagery
ADS	(1) Automated Data System; (2) Air Defense Sector; (3) Airlift Defensive System; (4) Acoustic SOF Detection System; (5) Advanced Distributed Simulation
ADSS	Aerospace Defense Systems Subcommittee
ADSTAR	Advanced Document Storage & Retrieval System
ADSW	Active Duty for Special Work
ADT	(1) Active Duty For Training; (2) Additional Duty Training
ADTLP	Army Doctrine and Training Literature Program
ADTOC	Air Defense Tactical Operations Center
ADTS	Adversary Threat Squadron
ADV	Advance(d)
ADVAL	Air Defense Evaluation Test
ADVON	Advanced Echelon
ADW	Air Defense Warning
ADX	Air Defense Exercise
ADZ	Air Defense Zone
AE	(1) Atomic Energy; (2) Assault Echelon; (3) Ammunition Ship; (4) Aerial Exploitation; Application Entity
AEAO	Airborne Emergency Action Officer
AEB	Aerial Exploitation Battalion
AEC	ASARS Exploitation Cell
AEDS	Atomic Energy Detection System
AEELS	(1) Automatic ELINT Emitter Location System; (2) Airborne ELINT Emitter Location System
AEICC	Area Emergency Information Coordination Center
AEM	Missile Tender
AEMS	Automated Edge Measurement System
AEN	Arbitrary ELINT Notation
AEOS	Advanced Electro-Optical Sensor
AEROFLOT	Former Soviet Union Civil Airline
AES	(1) Atomic Energy Site; (2) Airborne ELINT System
AESC	Aerospace Environmental Support Center
AETC	Air Education and Training Command
AETCAE	Army Europe Technical Control and Analysis Element
AEV	Armored Engineer Vehicle

AEW	Airborne Early Warning
AEW&C	Airborne Early Warning and Control
AF	(1) Air Force; (2) Armed Forces; (3) Stores Ship
AFAC	Airborne Forward Air Controller
AF ACSI	Air Force Chief of Staff Intelligence
AFAITC	Armed Forces Air Intelligence Training Center (Goodfellow AFB, TX).
AFAL	Air Force Armament Laboratory
AFAMPE	USAF Automated Message Processing Exchange
AFAMRL	Air Force Aerospace Medical Research Laboratory
AFAP	Artillery-Fired Atomic Projectile
AFARN	Air Force Air Request Net
AFAS	Advanced Field Artillery System
AFATDS	Advanced Field Artillery Tactical Data System
AFB	(1) Air Force Base; (2) Airframe Bulletin; (3) Antifriction Bearing
AFC	(1) Automatic Frequency Control; (2) All-source Fusion Center (Marine Corps)
AFC4A	USAF Command, Control, Communications and Computer Agency
AFCA	Air Force Collection Assets
AFCC	(1) Air Force Communications Command; (2) Air ForceComponent Command
AFCEA	Armed Forces Communications Electronics Association
AFCENT	Allied Forces Central Europe (NATO)
AFCS	(1) Automatic Flight Control System; (2) Army Facility Component System
AFCSC	Air Force Cryptologic Support Center
AFDB	Auxiliary Floating Drydock (large)
AFDD	Air Force Doctrine Document
AFDIGS	Air Force Digital Graphic Systems
AFDL	Auxiliary Floating Drydock (small)
AFDM	Auxiliary Floating Drydock (medium)
AFDT	AEELS Fixed Downlink Terminal
AFEOC	Air Force Emergency Operations Center
AFEWC	Air Force Electronic Warfare Center
AFFIS	Airfield Facilities Information System
AFFOR	Air Force (Component) Forces
AFGCCS	USAF Global Command and Control System
AFGL	Air Force Geophysics Laboratory
AFGWC	Air Force Global Weather Central
AFGWC/FNOC	Air Force Global Weather Center/Fleet Numerical Operations Center
AFGWS	Air Force Ground Weather Stations
AFIA	Air Force Intelligence Agency
AFIC	(1) Air Force Information Center; (2) Air Force Intelligence Command; (3) Air Force Intelligence Center

AFICE	Air Forces Iceland
AFICP	Air Force Intelligence Communications Plan
AFIES	Armed Forces Imagery Exploitation System
AFIISP	Air Force Intelligence Information Systems Plan
AFIO	Association of Former Intelligence Officers
AFIP	Air Force Intelligence Plan
AFIS	Air Force Intelligence Service/Study
AFISA	Air Force Intelligence Support Agency
AFIT	Air Force Institute of Technology
AFITC	Air Force Intelligence Training Center
AFIWC	Air Force Information Warfare Center
AFLAN	AFSOC Local/Wide Area Network
AFLANT	U.S. Air Forces, Atlantic
AFLC	Air Force Logistics Command
AFLE	Air Force Liaison Element
AFLO	Air Force Liaison Office
AFM	Air Force Manual
AFMD/GF	Air Forces of the Military District/Group of Forces
AFMC	Air Force Materiel Command
AFMIC	Armed Forces Medical Intelligence Center
AFMPC	Air Force Military Personnel Center
AFMSIS	Air Force Modeling and Simulation Information System
AFMSS	Air Force Mission Support System
AFNET	(1) Air Force Network; (2) Air Force Data Network
AFNORTH	Allied Forces Northern Europe (NATO)
AFNORTHWEST	(1) Allied Forces Northwest Europe (NATO); (2) Air Forces Northwest Region
AFOC	Air Force Operations Center
AFOE	Assault Follow-On Echelon
AFOSI	Air Force Office of Special Investigations
AFOSP	Air Force Office of Security Police
AFOSR	Air Force Office of Scientific Research
AFOTEC	Air Force Operational Test and Evaluation Center
AFR	(1) Air Force Reserve; (2) Air Force Regulation
AFRES	Air Force Reserve
AFS	(1) Air Force Station; (2) Combat Stores Ship
AFSAA	Air Force Studies and Analyses Agency
AFSAC	Air Force Special Activities Center
AFSAT	Air Force Satellite
AFSATCOM	Air Force Satellite Communications System
AFSC	(1) Air Force Systems Command; (2) Air Force Specialty Code; (3) Armed Forces Staff College
AFSCOORD	Assistant Fire Support Coordinator
AFSCF	Air Force Satellite Control Facility
AFSCN	Air Force Satellite Control Network

AFSIP	Air Force Satellite Intelligence Program
AFSOB	Air Force Special Operations Base
AFSOC	Air Force Special Operations Command
AFSOD	Air Force Special Operations Detachment
AFSOE	Air Force Special Operations Element
AFSOF	Air Force Special Operations Forces
AFSOS	Air Force Special Operations School
AFSOUTH	Allied Forces Southern Europe (NATO)
AFSOUTHCOM	Air Force Southern Command
AFSPACECOM	Air Force Space Command
AFSPC	Air Force Space Command
AFSPCIP	Air Force Space Command Intelligence Plan
AFSPOC	Air Force Space Operations Center
AFSSE	Air Force Space Surveillance Element
AFSST	Air Force Space Support Team
AFSTC	Air Force Space Technology Center
AFTAC	Air Force Technical Applications Center
AFTACIES	Air Force Tactical Imagery Exploitation System
AFTF	Air Force Task Force
AFTFWC	Air Force Tactical Fighter Weapons Center
AFV	Armored Fighting Vehicle
AF/VC	Air Force Vice Chief of Staff
AFWAL	Air Force Wright Aeronautical Laboratory
AFWARNS	Air Force Warning System
AFWCCS	Air Force Wing Command and Control System
AFWL	Air Force Weapons Laboratory
AG	(1) Adjutant General; (2) Miscellaneous Auxiliary Ship
AGARD	Advisory Group for Aerospace Research and Development (NATO)
AGB	Icebreaker
AGC	Automatic Gain Control
AGCCS	Army's Global Command and Control System
AGDS	Deep Submergence Support Ship
AGE	Experimental Auxiliary
AGEF	Frigate Research Ship
AGEH	Experimental Auxiliary (Hydrofoil)
AGER	Intelligence Research Ship
AGES	Advanced Ground Exploitation System
AGF	Miscellaneous Command Ship
AGHS	Patrol Combatant Support Ship
AGI	Intelligence Collection Ship
AGL	(1) Buoy Tender; (2) Above Ground Level
AGM	(1) Air-to-Ground Missile; (2) Missile Range Instrumentation Ship
AGMR	Major Communications Relay Ship

AGMS	Armored Ground Mobility System
AGOR	Oceanographic Research Ship
AGOS	(1) Ocean Surveillance Ship; (2) Air-Ground Operations School (NATO); (3) Air-Ground Operations System
AGP	Patrol Craft Tender
AGR	Army Guard Reserve
AGS	(1) Hydrographic Survey Ship; (2) FSU Automatic Grenade Launcher
AGT	Agent
AGZ	Actual Ground Zero
AH	(1) Hospital Ship; (2) Alternate Headquarters
AHFEWS	Army High Frequency Electronic Warfare System
AI	(1) Airborne Intercept; (2) Air Intelligence; (3) Artificial Intelligence; (4) Air Interdiction; (5) Airborne Interceptors; (6) Area of Interest; (7) All-Source Intelligence
A3I	Accelerated Architecture Acquisition Initiative
AIA	(1) Army Intelligence Agency; (2) ACE Intelligence Architecture; (3) ACE Interface Architecture; (4) Air Intelligence Agency
AIAA	American Institute of Aeronautics and Astronautics
AIA/IRD	Air Intelligence Agency/Intelligence Reserve Detachment
AIAWS	Automated Intelligence Analyst Workstation
AIB	Atlantic Intelligence Board
AIC	(1) Atlantic Intelligence Command; (2) Afloat Intelligence Center
AICBM	Anti-Intercontinental Ballistic Missile
AID	(1) U.S. Agency for International Development; (2) Aerospace Information Digest; (3) Army Information Digest; (4) Accident, Incident, Deficiencies; (5) Active Integral Defense
AIDES	(1) Analyst Intelligence Information Display and Exploitation System; (2) Automated Intelligence Display and Exploitation System
AIDS	(1) Acoustic Intelligence Data System; (2) Advanced Identification System; (3) Acquired Immune Deficiency Syndrome
AIF	(1) Automated Installations Intelligence File; (2) Army Industrial Fund; (3) Airfield Installation File; (4) Air Intelligence Flight; (5) Automated Installation File
AIFV	Armored Infantry Fighting Vehicle
AIG	(1) Address Indicator Group; (2) Air Intelligence Group
AIIC	Advanced Imagery Interpretation Course
AIIF	Automated Installation Intelligence File
AIIRS	Automated Intelligence Information Retrieval System
AIM	(1) Air Intercept Missile; (2) Active Inert Missile; (3) ADCOM Intelligence Memorandum
AIMD	Aircraft Intermediate Maintenance Department
AIMP	(1) Army Intelligence Management Plan; (2) Army Intelligence Master Plan; (3) Advanced Imagery Management Program; (4) Automated Information Management Program

AIMTB	Artificial Intelligence Module Testbed
AIN	Advanced Intelligence Network
AIO	Air Intelligence Officer
AIOEC	Association of Iron Ore Exporting Countries
AIP	(1) Architecture Implementation Plan; (2) Anti-Surface-Warfare Improvement Program
AIPR	Automated Information Processing Request
AIR	American Institute for Research
AIRA	Air Attache
AIRCENT	(1) Air Forces Central Region (NATO); (2) Allied Air Forces Central Europe
AIRCOM	Air Command
AIRCOMTERM	Airborne Communications Terminal
AIRES	Advanced Imagery Requirements and Exploitation System
AIRES II	Airborne Reconnaissance Electronic System II
AIREW	Airborne Infrared Early Warning
AIRK	Area Interswitch Rekeying Key
AIRLO	Air Liaison Officer
AIRREQRECON	Air Request Reconnaissance
AIR	(1) Replenishment Oiler; (2) American Institute of Research
AIRS	(1) Advanced Inertial Reference Sphere; (2) Automated Information Retrieval Systems
AIRTAPS	Aerial Imagery Reconnaissance Tracking and Plotting System
AIS	(1) Automated Indicator System; (2) Advanced Indications Structure; (3) Advanced Indications System; (4) Army Intelligence Survey; (5) Automated Information System; (6) Air Intelligence Squadron
AISA	Automated Intelligence Support Activity
AISS	Automated Information Systems Security
AIST	Air Intelligence Support Team
AITE	Advanced Indications Technology Experiment
AIU	Army Interrogation Unit
AIWO	Air Intelligence Warning Officer
AIWS	Advanced Interdiction Weapon System
AJ	Antijamming
AJCC	Alternate Joint Communications Center
AJFP	Adaptive Joint Force Package
AJNPE	Airborne Joint Nuclear Planning Element
A/JSIC	Alternate JSIC
AK	(1) Cargo Ship; (2) FSU Kalashnikov Family of Assault Rifles; (3) Automatic Remote Rekeying
AKA	Also Known As
AKDC	Automatic Key Distribution Center
AKD/RCU	Automatic Key Distribution/Rekeying Control Unit
AKL	Light Cargo Ship
AKM	(1) Apogee Kick Motor; (2) AK-47 Assault Rifle
AKMC	Automated Key Management Center

AKMS	Automated Key Management System
AKR	Vehicle Cargo Ship
AKTCAE	Army Korea Technical Control And Analysis Element
ALAIRCOM	Alaskan Air Command
ALARM	Alert, Locate and Report Missiles
ALASAT	Air-Launched Antisatellite
ALASCOM	Alaskan Communications Inc.
ALB	Air-Land Battle Doctrine (FM 100-5)
ALBM	Air-Launched Ballistic Missile
ALC	Accounting Legend Code
ALCATS	Automated Lines of Communication and Target System
ALCC	Airlift Control Center
ALCE	Airlift Control Element
ALCM	Air-Launched Cruise Missile
ALCOM	Alaskan Command
ALCOP	Alternate Command Post
ALCOR	ARPA Lincoln C-Band Observable Radar
ALCS	Airborne Launch Control System
ALD	Airlift Division
ALE	(1) AIRES Lifecycle Extension; (2) Automated Link Establishment
ALERT	Attack and Launch Early Report to Theater (AF)
ALES	AIRES Life Extension System
ALF	Auxiliary Landing Field
ALFA	Advanced Liaison Forward Area
ALL	Airborne Laser Laboratory
ALMS	Automated Logistics Management System
ALO	(1) Air Liaison Officer; (2) Authorized Level of Organization
ALOC(S)	Air Line(s) of Communication
ALPS	Accidental Launch Protection System
ALRAAM	Air-Launched Long-Range Air-to-Air Missile
ALRP-S	Army Long-Range Plan for Space
ALRPG	Army Long-Range Planning Guidance
ALS	(1) Active Laser Seeker; (2) Airborne Link Segment
ALSA	Air-Land-Sea Application (Center)
ALSS	Advanced Location Strike System
ALT	(1) Alternate; (2) Altitude
ALTAlR	ARPA Long-Range Tracking and Instrumentation Radar
ALTREV	Altitude Reservation
ALUSNA	American Legation U.S. Naval Attache
ALUSNLO	American Legation U.S. Naval Liaison Officer
ALWT	Advanced Lightweight Torpedo
ALWTIC	Annual Land Warfare Technical Intelligence Conference

AM	(1) Ante Meridian (Before Noon); (2) Amplitude Modulation; (3) Asset Manager; (4) Aerographers Mate
AMAB	Air Mobile Assault Brigade
AMASS	(1) Advanced Marine Airborne SIGINT System; (2) Advanced Marine Air Support System
AMBISS	Automated Map-Based Intelligence Support System
AMC	(1) Airspace Management and Control; (2) Army Materiel Command (Formerly DARCOM); (3) Air Mobility Command; (4) Air Mission Commander
AMCC	(1) Ashore Mobile Contingency Communications; (2) Ashore Mobile Command Center
AMC/IN	AMC Deputy Chief of Staff for Intelligence
AMCIT	American Citizen
AMCM	Airborne Mine Countermeasures
AMD	Activated Metal Decoy
AMDT	AEELS Mobile Downlink Terminal
AME	Airspace Management Element
AMEMB	American Embassy
AMETS	Artillery Meteorological System
AMF	Allied Command Europe Mobile Force (NATO)
AMH	Automated Message Handling
AMHA	Army Management Headquarters Activity
AMHS	Automated Message Handling System
AMIDS	Airborne Mine Detection System
AMIM	Army Modernization Information Memorandum
AMIP	Army Model Improvement Plan
AMIRS	Army Multispectral Imagery Requirements Study
AMIS	Advanced Microwave Imaging Sensor
AMM	Army Modernization Memorandum
Ammo	Ammunition
AMMS	(1) Allowance Material Management System; (2) Acquisition Milestone Management System
AMOPES	Army Mobilization and Operations Planning and Execution System
AMOPS	Army Mobilization Operations and Planning System
AMOS	Air Force Maui Optical System
AMP	(1) Amplification; (2) Army Modernization Plan; (3) Acquisition Master Plan
AMPDS	Automated Message Processing Dissemination System
AMPE	Automated Message Processing Exchange
AMPHI	Aerial Mission Photographic Indoctrination
AMPHIB	Amphibious
AMPL	Amplitude
AMPS	(1) Automated Mission Planning System; (2) Automated Message Processing System; (3) Aim Point System
AMRAAM	Advanced Medium-Range Air-to-Air Missile

AMRWS	Advanced Remote Miniaturized Weather Station
AMS	(1) Automated Message System; (2) Auto-Manual System; (3) Autonomous Message Switch; (4) Advanced Mapping Spectrometer
AMSAT	Amateur Radio Satellite
AMSC	Advanced Military Spaceflight Capability
AMS-H	Advanced Missile System Heavy
AMSSA	Assured Mission Support Space Architecture
AMST	Advanced Medium STOL Transport
AMT	ACTS Mobile Terminal
AMTF	Airmobile Task Force
AMTP	Army Mission Training Plan
AMU	Astronaut Maneuvering Unit
AMW	Amphibious Warfare
AN	(1) Net Tender; (2) Army/Navy
ANALIT	Analyst-to-Analyst Message Format
ANC	African National Congress
ANCC	(1) Ashore Navy Communications Capability; (2) Automated Network Control Center
ANDVT	Advanced Narrowband Digital Voice Terminal
ANEX	Analyst-to-Analyst Exchange Message Format
ANFO	Ammonium Nitrate Fuel Oil
ANG	Air National Guard
ANGB	Army National Guard Base
ANGLICO	Air and Naval Gunfire Liaison Company
ANL	Net-Laying Ship
ANLYS	Analysis
ANMCC	Alternate National Military Command Center
ANMIC	Alternate National Military Intelligence Center
ANR	(1) Alaskan NORAD Region; (2) Active Noise Reduction
ANRPC	Association of Natural Rubber-Producing Countries
ANSI	American National Standards Institute
ANVIS	Aviator's Night Vision Imaging System
AN/VRC	Army Navy Vehicle Radio Communications
ANZUS	Australia, New Zealand, United States
AO	(1) Action Officer; (2) Oiler; (3) Authenticator Organization; (4) Area of Operations; (5) Aerial Observer
AOA	(1) Amphibious Objective Area; (2) Angle of Attack; (3) Angle of Arrival; (4) Airborne Optical Adjunct
AOB	(1) Air Order of Battle; (2) Advanced Operational Base
AOBTS	Air Order of Battle Textual Summary
AOC	(1) Air Officer Commanding (U.K.); (2) Air Operations Center; (3) Army Operations Center
AOCC	Area Operations Control Center
AOCS	Aviation Officers Candidate School
AOE	Fast Combat Support Ship
AOFDA	U.S. AID Office for Foreign Disaster Assistance

AOG	Gasoline Tanker
AOI	(1) Area of Influence; (2) Area of Interest
AOIC	Assistant Officer in Charge
AOIR	(1) ACE Operational Intelligence Requirements; (2) Area of Intelligence Responsibility
AOL	Area of Limitation
AO&M/NM	Administration, Operations, and Maintenance/Network Management
AOO	Air Operations Order
AOP	(1) Area of Probability; (2) Air Operations Plan
AOR	Area of Responsibility
AOS	(1) Special Liquids Tanker; (2) Amphibious Objective Study; (3) Area of Separation
AOSG	Amphibious Operation Support Graphic
AOSS	Automated Office Support System
AOT	Transport Oiler
AOTF	Acoustic-Optic Tunable Filter
AP	(1) Armor-Piercing; (2) Air Police; (3) Transport Ship; (4) Associated Press; (5) Ammonium Perchlorate; (6) Antipersonnel; (7) Application Processor
AP-I	Armor Piercing Incendiary
APB	(1) Self-Propelled Barracks Ship; (2) All Points Bulletin; (3) Antipersonnel Bomb; (4) Acquisition Program Baseline
APC	(1) Armored Personnel Carrier; (2) Area of Positive Control; (3) Adaptive Predictive Coding
APCC	Alternate Processing and Correlation Center
APFSDS	Armor-Piercing, Fin-Stabilized, Discarding Sabot
APHIS	USDA Animal and Plant Health Inspection Service
APL	(1) Barracks Craft (non self-propelled); (2) Applied Physics Laboratory (Johns Hopkins University)
APM	Army Program Memorandum
APMS	(1) Automated Production Management System; (2) Advanced Precision Measurement System
APO	(1) Army Post Office; (2) Air Post Office
APOD	Aerial Port of Debarkation
APOE	Aerial Port of Embarkation
APORTS	Aerial Ports File (JOPES)
APP	Application
APPS	Applications
Appl	Application
Approx	Approximately
APPS	Analytical Photogrammetric Position System
APS	(1) ASARS-II Processing Segment; (2) Air Planning System
APT	(1) Automatic Picture Transmission; (2) Airport
APU	Auxiliary Power Unit
APVO	FSU Air Defense Aviation
APW	American Prisoner of War

AQF	Advanced QUICKFIX
AR	(1) Advanced Readiness; (2) Army Regulation; (3) Action Required; (4) Repair Ship; (5) Agent Report; (6) Army Reserve; (7) Army
ARABSAT	Arab Satellite (Communications Organization)
ARB	Battle Damage Repair Ship
ARC	(1) Cable Ship; (2) Acquisition Review Committee; (3) Armored Reconnaissance Carrier; (4) Air Reserve Component
ARCENT	U.S. Army Forces Central Command
ARCENT-K	USACENT forward element-Kuwait
ARCENT-SA	USACENT forward element-Saudi Arabia
ARCH	Architecture
ARCOM	Army Command
ARDC	Air Research and Development Command
AREC	Air Element Coordinator
ARCS	(1) Automated Reproduction and Collating System; (2) Acquisition Radar and Control System
ARD	Auxiliary Repair Drydock
ARDF	Airborne Radio Direction Finding
ARDM	Auxiliary Repair Drydock
AREPT	Agent Report
ARF	Airborne Relay Facility
ARFCOS	Armed Forces Courier Service
ARFOR	Army Force(s)
ARG	(1) Amphibious Readiness Group; (2) Internal Combustion Engine Repair Ship
ARIS	Advanced Range Instrumentation Ship
ARL	(1) Landing Craft Repair Ship; (2) Airborne Reconnaissance Low; (3) Army Research Lab; (4) Aerial Reconnaissance Liaison
ARL-I	Airborne Reconnaissance Low-Imagery
ARLANT	U.S. Army Forces, LANTCOM
ARLEA	Army Logistics Evaluation Agency
ARLO	Air Reconnaissance Liaison Officer
ARM	(1) Antiradiation Missile; (2) Atmospheric Radiation Measurement
ARMA	Army Attache
ARMISE	Army Reserve Military Intelligence Support Element
ARMLO	Army Liaison Officer
ARMS	Automated Resource Management System
ARNG	Army National Guard
ARO	(1) Area Records Officer; (2) Auxiliary Readout
ARP	Alert Response Plan
ARPA	Advanced Research Projects Agency
ARPAC	Army Pacific
ARPANET	Advanced Research Projects Agency Network
ARPS	Advanced Radar Processing System

ARPV	Advanced Remotely Piloted Vehicle
ARR	Radiological Repair Ship
ARRC	(1) ACE Rapid Reaction Corps; (2) Allied Rapid Reaction Corps
ARRN	Andean Ridge Radar Network
ARRS	Aerospace Rescue and Recovery Service
ARS	(1) Salvage and Rescue Ship; (2) Aerial Reconnaissance and Surveillance; (3) Airborne Receiver System; (4) Air Rescue Service
ARSA	(1) Annual Reevaluation of Safe Areas; (2) Airborne Reconnaissance and Surveillance Architecture
ARSGS	Airborne Reconnaissance SIGINT Ground Systems
ARSO	Assistant Regional Security Officer
ARSOA	Army Special Operations Aviation
ARSOC	Army Special Operations Command
ARSOF	Army Special Operations Forces
ARSOFE	Army Special Operations Forces, Europe
ARSOFSUPCOM	Army Special Operations Forces Support Command
ARSOTF	Army Special Operations Task Force
ARSP	Advanced Reconnaissance Support Program
ARSPACE	Army Space Command
ARSPACECOM	Army Space Command
ARSPOC	Army Space Operations Center
ARSST	Army Space Command Space Support Team
ARSTAF	Army Staff
ART	(1) Aerial Reconnaissance Team; (2) Amateur Radio Transceiver
ARTADS	Army Tactical Data System
ARTAS-K	Army Training and Support-Kuwait (former name for ARCENT-K)
ARTBASS	Army Training Battle Simulation Systems
ARTCC	Air Route Traffic and Control Center
ARTEP	(1) Army Readiness Training Evaluation Program; (2) Army Training and Evaluation Program
ARTISS	Advanced Requirements Tasking Information and Support System
ARTPP	Airborne Reconnaissance Technology Program Plan
ARTS	Automated Remote Tracking Station
ARTY	Artillery
ARV	(1) Armored Recovery Vehicle; (2) Armored Reconnaissance Vehicle; (3) Aircraft Repair Ship
ARW	Air Refueling Wing

AS	(1) Submarine Tender; (2) Air Surveillance; (3) Analysis Subsystem; (4) Air Station; (5) Anti Spoofing; (6) Advanced Sensors
ASA	Army Space Agency
ASA	(M&RA)Assistant Secretary of the Army (Manpower and Reserve Affairs)
ASAB	All-Source Analysis Branch
ASAC	All-Source Analysis Center
ASAP	(1) As Soon As Possible; (2) Advanced Sensor Applications Program
ASAR	Advanced Synthetic Aperture Radar
ASARC	Army Systems Acquisition Review Council
ASARS	Advanced Synthetic Aperture Radar System
ASART	(1) AEELS Support Analysis Reporting Terminal; (2) Analysis Support and Reporting Terminal
ASAS	All-Source Analysis System
ASAS-AS	All-Source Analysis System All-Source Workstation
ASAS-E	All-Source Analysis System-Extended
ASAS-SS	All-Source Analysis System Single-Source Workstation
ASAS-W	All-Source Analysis System WARRIOR
ASAT	(1) Antisatellite; (2) Antisatellite Treaty; (3) Advance Satellite Antenna Technology
ASB	(1) Air Surveillance Broadcast; (2) Army Science Board
ASC	(1) AUTODlN Switching Center; (2) Army Service Component; (3) Army Space Command; (4) Advanced Systems Course
ASCAMP	Advanced Single-Channel Manpack
ASCII	American Standard Code for Information Interchange
ASCC	(1) Air Standardization Coordinating Committee; (2) Alternate Space Control Center
ASCII	American National Standard Code for Information Interchange
ASCM	Antiship Cruise Missile
ASCON	Automatic Switched Communications Network
ASD	Assistant Secretary of Defense
ASD (C3I)	Assistant Secretary of Defense (Command, Control, Communications, and Intelligence)
ASD (C4I)	Assistant Secretary of Defense (Command, Control, Communications, Computers and Intelligence)
ASD (ISA)	Assistant Secretary of Defense for International Security Affairs
ASD (S&R)	Assistant Secretary of Defense for Strategy and Requirements
ASD (SO/LIC)	Assistant Secretary of Defense for Special Operations and Low Intensity Conflict
ASDC	Advanced Space Data Corporation
ASDEP	Army Space Exploitation Demonstration Programs
ASDIA	All-Source Document Index
ASDIAZ	All-Source Document Index Automated File-Compartmented
ASDIAZO	All-Source Document Index Automated File-ORCON
ASDIC	Armed Services Documents Intelligence Center

ASDS	(1) Automated SIGINT Dissemination System; (2) Advanced SEAL Delivery System
ASDV	Auxiliary SEAL Delivery Vehicle
ASE	(1) Aircraft Survivability Equipment; (2) Airborne Support Element
ASEAN	Association of Southeast Asian Nations
ASED	Army Space Exploitation Demonstration
ASEDP	Army Space Exploitation Demonstration Program
ASEMA	Army Special Electronic Mission Aircraft
ASF	All-Source Format
ASFC	All-Source Fusion Center
ASG	Area Support Group
ASGOBS	Army Standard Ground Order of Battle System
ASI	(1) Additional Skill Indicator; (2) U.S. Army Space Institute; (3) All-Source Intelligence
ASIC	All-Source Intelligence Center
ASICC	All-Source Intelligence Coordinating Center
ASIDS	Airborne Secondary Imagery Dissemination System
ASIP	All-Source Imagery Processor
ASIPS	Army Standard Intelligence Plotter System
ASIS	Army Space Initiatives Study
ASIT	Adaptable Surface Interface Terminal
ASM	(1) Air-to-Surface Missile; (2) Antiship Missile; (3) Attache Support Message
ASMD	Antiship Missile Defense
ASMT	Assessment
ASN (RDA)	Assistant Secretary of the Navy (Research, Development and Acquisition)
ASOC	Air Support Operations Center
ASOG	Air Support Operations Group
ASOS	Air Support Operations Squadron
ASP	Ammunition Supply Point
ASPAC	Asian and Pacific Council
ASPADOC	Alternate Space Defense Operations Command
ASPB	Assault Patrol Support Boat (Riverine Warfare Craft)
ASPIC	Armed Services Personnel Interrogation Center
ASPJ	Airborne/Advanced Self-Protection Jammer
ASPO	Army Space Program Office
ASPS	All-Source Production Section
ASR	(1) Submarine Rescue Ship; (2) Airport Surveillance Radar; (3) Adaptive Situation Recognizer
ASRP	(1) Airborne SIGINT Reconnaissance Program; (2) Airborne SIOP Reconnaissance Plan
ASRRS	Army Survivable, Recovery and Reconstitution System
ASSC	Alternate Space Surveillance Center
ASSET	All Source Satellite Evaluation Tool

ASSIST	(1) Army System for Standard Intelligence Support Terminals; (2) Automated Special Security Terminals; (3) Automated Special Security Information System; (4) Automated Information System Security Incident Support Team
ASSM	Antiship Surface Missile
ASSOTW	Airfields and Seaplane Stations of the World
ASSR	Autonomous Soviet Socialist Republic
ASST	(1) Antiship Surveillance and Tracking; (2) Assistant
ASSW	Antisurface Ship Warfare
ASTAG	Army Service and Technology Advisory Group
ASTEC	Advanced Satellite Technology and Extremely High Frequency Communications
ASTERIX	Automated Analyst Support Tools
ASTMP	Army Science and Technology Master Plan
ASTP	APOLLO-SOYUZ Test Program
ASU	(1) FSU Airborne Self-Propelled Antitank Gun; (2) Approved for Service Use
ASUW	Antisurface Warfare
ASU SWA	Administrative Support Unit Southwest Asia
ASUWC	Antisurface Warfare Commander
ASV	Armored Support Vehicle
ASW	(1) Antisubmarine Warfare; (2) Aircrew Survival Weapon
ASWC	Antisubmarine Warfare Commander
ASWCCS	Antisubmarine Warfare Command and Control System
ASWOC	Antisubmarine Warfare Operations Center
ASWTF	Antisubmarine Warfare Task Force
AT	(1) Antitank; (2) Air Transit; (3) Simple Antenna (Electronic Component); (4) Air Technician; (5) Awaiting Transportation; (6) Antiterrorism, (7) Annual Training
ATA	(1) Actual Time of Arrival; (2) Ocean Tug; (3) Air Transport Association; (4) Advanced Tactical Aircraft; (5) Air Traffic Agency
ATAC	ASAP Technical Advisory Committee
ATACC	Advanced Tactical Air Command Center
ATACMS	(U.S.) Army Tactical Missile System
ATACMS ER	Army Tactical Missile System Extended Range
ATACS	(1) Analyst-to-Analyst Communications Service; (2) Army Tactical Communications System
ATAF	Allied Tactical Air Force (NATO)
ATARS	Advanced Tactical Aerial Reconnaissance System
ATAS	(1) Air-To-Air Stinger; (2) Automatic Terrain Avoidance System
ATB	(1) Air Technical Battalion; (2) Advanced Technology Bomber
ATBM	Antitactical Ballistic Missile
ATC	(1) Air Traffic Control; (2) Air Training Command, USAF; (3) Air Target Chart; (4) Mini-Armored Troop Carrier (Riverine Warfare Craft)
ATCAE	Army Technical Control and Analysis Element

ATCC	Air Traffic Control Center
ATCCS	Army Tactical Command and Control System
ATCH	ASW Torpedo-Carrying Helicopter
ATCU	Airfield Traffic Control Unit
ATD	(1) Actual Time of Departure; (2) Advanced Technology Demonstration
ATDB	ACE Target Data Base
ATD/IFD	Advanced Technology Demonstration/Integrated Feasibility Demonstration
ATDL	Automated Tactical Data Link
ATDS	Airborne Tactical Data System
ATE	Automatic Test Equipment
ATETS	Atomic Heat and Powerplant
ATF	(1) Advanced Tactical Fighter; (2) Amphibious Task Force; (3) Fleet Ocean Tug; (4) Aviation Turbine Fuel; (5) After the Fact
ATFD	Automated Tactical Fusion Division
ATGIN	Atomic Ground Intercept
ATGL	Antitank Guided Launcher
ATGM	Antitank Guided Missile
ATH	Above The Horizon
ATI	Automated Tactical Intelligence
ATIC	Aircraft Technical Intelligence Conference
ATIMS	Advanced Technical Information Management System
ATL	ACE Threat List
ATLIS	Airborne Tracking Laser Identification System
atm	Atmosphere
ATM	(1) Antitank Missile; (2) Air Target Materials; (3) Air Target Mosaic; (4) Antitactical Missile; (5) Asynchronous Transfer Mode; (6) Air Tasking Message
A-TM	Alpha Team (Special Forces Operational Detachment)
ATMDE	Army Theater Missile Defense Element
ATMG	Arms Transfer Management Group
ATMOS	Atmospheric Trace Molecules Spectroscopy
ATMP	Air Target Materials Program
ATO	(1) Air Tasking Order; (2) Abort-To-Orbit
ATOC	Allied Tactical Operations Center (NATO)
AFTOCONF	Air Tasking Order Confirmation
ATOL	Assisted Takeoff & Landing
ATOS	Atlantic Theater Operational Intelligence System
ATP	(1) Allied Tactical Publication (NATO); (2) Advanced Technology Program; (3) Advanced Tracking Prototype; (4) Advanced Tactical Planner
ATP-FO	Automated Tracking Prototype Follow-On
ATP/RMBUX	Advance Tracking Prototype/Rocky Mountain Basic UNIX
ATR	Automatic Target Recognition
ATRS	Advanced Tactical Reconnaissance System

ATS	(1) Salvage and Rescue Ship; (2) Automated Tasking System; (3) Audit Trail Server; (4) Applications Technology Satellite
ATSS	Alaskan Transportable Satellite System
AT&T	American Telephone and Telegraph
ATT	Technical Assistance Training Team
ATTCS	Army Tactical Command and Control System
ATTD	Advanced Technology Transition Demonstration
ATTE	Assistant Theater Topographic Engineer
ATTG	Automated Tactical Target Graphic
ATTN/Attn	Attention (to the attention of)
ATTP	ACOM Tactics, Techniques, and Procedures
ATWC	Atmospheric Tactical Warning Connectivity
AU	Air University
AUD	Arbitrary Unit Designator
AUGTDA	Augmentation Table of Distribution and Allowances
AUM	Air-to-Underwater Missile
AUS	Army of the United States
AUSA	Association of the United States Army
AUSCANUKUS	Australia, Canada, United Kingdom, United States
AUSD	Assistant Deputy Under Secretary for Defense
AutoID	Automatic Identification
AUTODIN	Automatic Digital Network
AUTOSEC	Automation Security
AUTOSEVOCOM	Automatic Secure Voice Communications Network
AUTOVON	Automatic Voice Network
AUTUMN FORGE	NATO Exercise
AUXCP	Auxiliary Command Post
AV	(1) Armored Vehicle; (2) Audio-Visual; (3) Air Vehicle; (4) Auxiliary Vector
AVCS	Attitude and Velocity Control System
AVF	All-Volunteer Force
AVGAS	Aviation Gasoline
AVHRR	Advanced Very High Resolution Radiometer
AVIM	Aviation Intermediate Maintenance
AVLB	Armored Vehicle-Launched Bridge
AVMF	FSU Naval Aviation
AVMT	Aviation Maintenance Trainer
AVN	Aviation
AVP	Authorized Vendor Program
AVR	Aircraft Rescue Vehicle
AVSAT	Aviation Satellite System
AVSCOM	Aviation System Command
AVT	Auxiliary Aircraft Landing Training Ship
AVUM	Aviation Unit Maintenance

CAIF	Command Automated Intelligence File

CAIMS	Conventional Ammunition Information Management System
CAJIT	Central America Joint Intelligence Team
CaLANdar	Da Vinci E-Mail Application
CALS	Computer-Aided Acquisition and Logistics Support
CALT	Civil Affairs Liaison Team
CAM	(1) Computer-Assisted Modeling; (2) Computer Aided Manufacturing
CAMO	Computer-Aided Manual Operation
CAMPS	(1) Computer-Aided Management Planning System; (2) Computer-Aided Mission Planning System; (3) Compartmented All-Source Analysis System Message Processing System
CAMS	(1) COMIREX Automated Management System; (2) Communications Area Master Station
CANDOB	Consolidated Aerospace Defense Order of Battle
CANR	Canadian NORAD Region
CAN	Coastal Air Navigation Supplement
CANT	Chinese Atmospheric Nuclear Test
CANUK	US Canada, United Kingdom, United States
CANUS	Canadian - United States
CANUS LANDOP	Canada-United States Land Operations Plan
CAO	(1) Crisis Action Organization; (2) Chief Administrative Officer; (3) Central Action Office
CAO(SOP)	Coordination of Atomic Operations (Standard Operating Procedure)
CAOC	Combined Air Operations Center
CAOCC	Combined Air Operations Coordination Center
CAP	(1) Combat Air Patrol; (2) Civil Air Patrol; (3) Countermeasures Advisory Panel; (4) Crisis Action Planning; (5) Crisis Action Procedures; (6) Capabilities
CAPSULE JACK	Proper Name of System
CAR	(1) Canadian Airborne Regiment; (2) Chief, Army Reserve
CARC	Corrective Action Review Committee
CARDA	(1) Continental Airborne Reconnaissance for Damage Assessment; (2) CONUS Airborne Reconnaissance for Damage Assessment
CARE	Cooperative for American Relief Everywhere, Inc.
CARG	Crisis Action Review Group
CARGRU	Carrier Group
CARIBJIC	Caribbean Joint Intelligence Center
CARIBROC	Caribbean Regional Operations Center
CARICOM	Caribbean Common Market
CARIFTA	Caribbean Free Trade Association
CARL	Category Assignment Responsibility List
CARP	Computed Air Release Point
CARS	(1) Contingency Airborne Reconnaissance System; (2) Common Automated Recovery System

CARVE	Criticality, Accessibility, Recuperability, Vulnerability, and Effect
CARVER	Criticality, Accessibility, Recuperability, Vulnerability, Effects and Recognizability
CAS	(1) Close Air Support; (2) Calibrated Air Speed; (3) Collision Avoidance System; (4) Crisis Action System; (5) Crisis Action Staff; (6) Combined Arms and Services Staff School
CASC	Crisis Action Support Cell
CASE	Computer-Assisted Software Engineering
CASIC	Combined All-Source Intelligence Center
CASLAN	Command Automated Software Local Area Network
CASS	(1) Collection Analysis Support Subsystem; (2) Command Activated Sonobuoy System
CAST	(1) Catalogue of Approved Scientific and Technical Intelligence Tasks; (2) Canadian Air/Sea Transport Group; (3) Computer-Assisted Self Training; (4) Computer Assisted Satellite Track
CAT	(1) Conventional Arms Transfer; (2) Crisis Action Team; (3) Combined Arms Team; (4) Crisis Augmentation Team; (5) Category
CAT-1	RECategory-1 Receive Equipment
CATF	(1) Commander, Amphibious Task Force; (2) Civil Affairs Task Force
CATIS	(1) Computer-Aided Tactical Information System; (2) Computer-Aided Tactical Intelligence System
CATIS/IESS	Computer-Aided Tactical Information System/Imagery Exploitation Support System
CATS	(1) Combined Arms Training Systems; (2) Combat Airlift Tactics' School
CATSS	Cartographic Applications for Tactical and Strategic Systems
CAV	Cavalry
CAVU	Ceiling And Visibility Unlimited
CAWS	Commercial Analyst Work Station
CB	Chemical, Biological
C-band	3.9 to 6.2 GHz Communications Band
CBD	Commerce Business Daily
CBF	Common Budget Framework
CBI	(1) Complete Background Investigation; (2) Computer Based Instruction
CBI/T	Computer-Based Instruction/Training
CBJB	Congressional Budget Justification Book
CBM	Confidence Building Measure(s)
CBO	Congressional Budget Office
CBR	(1) Chemical, Biological, and Radiological; (2) Case Based Reasoning; (3) Constant Bit Rate
CBRN	Caribbean Basin Radar Network
CBRS	Concept Based Requirements System
CBS	Combat Battle Simulation
CBT	(1) Computer-Based Training; (2) Combating Terrorism

CBTDEV	Combat Developer
CBTI	Combat Intelligence
CBU	Cluster Bomb Unit
CBW	Chemical and Biological Warfare
CBZ	Confidence Building Zone
CC	(1) Command Center; (2) Command Ship; (3) Cloud Cover; (4) Collection Center; (5) Computer Compatible; (6) Communications Controller; (7) Commander
C-C3	Counter Command, Control, and Communications
CCA	Communications Control Authority
CCB	Configuration Control Board
CCC	(1) CARDA Control Center; (2) Consolidated Command Center; (3) Command and Control Center
CCD	(1) Conference of the Committee on Disarmament; (2) Charged Coupled Device; (3) Camouflage, Concealment, and Deception
CCE	Contingency Communications Element
CCEB	Combined Communications Electronic Board
CCEP	Commercial COMSEC Endorsement Program
CCF	Collection Coordination Facility
CCF-SS	Collection Coordination Facility-Support System
CCG	(1) Combat Control Group; (2) Crisis Coordination Group; (3) Combat Communications Group
CCG-NB	Communications Control Ground-Narrowband
CCGD	Commander, Coast Guard District
CCGP	Combat Communications Group
CCHC	Headquarters Commandant
CCI	Controlled Cryptographic Item
CCIC	Concentrated Counterdrugs Intelligence Collection
CCIP	Command Center Improvement Program
CCIR	International Radio Consultative Committee (French Acronym)
CCIRID	Charge-Coupled Infrared Imaging Device
CCIRM	Collection Coordination and Intelligence Requirements Management
CCIS	(1) Command, Control, and Intelligence Support; (2) Common Channel Intelligence Signaling
CCISCMO	Community Counterintelligence and Security Countermeasures Office
CCISS	Command & Control Intelligence Support Squadron
CCITT	Consultative Committee for International Telephone and Telegraph
CCJ1	USCENTCOM Manpower, Personnel, and Administration Directorate
CCJ2	USCENTCOM Intelligence Directorate
CCJ3	USCENTCOM Operations Directorate
CCJ4/J7	USCENTCOM Logistics and Security Assistance Directorate
CCJ5	USCENTCOM Plans and Policy Directorate

CCJ6	USCENTCOM Command, Control, Communications, and Computer Systems Directorate
CCJA	USCENTCOM Staff Judge Advocate
CCM	(1) Cross-Country Movement; (2) Counter-Countermeasure
C3CM	Command, Control, and Communications Countermeasures
CCMF	Consolidated Collection Management Facility
CCN	Crisis Communications Network (CIA)
CCO	(1) Communication Collection Outstation; (2) COMINT Collection Outstation; (3) Circuit Control Officer; (4) Chief, Combat Operations
CCO/SCO	Central Control Office/Sub-Control Office
CCP	(1) Consolidated Cryptologic Program; (2) Communications Checkpoint; (3) Contingency Communications Package
CCPC	Critical Collection Problems Committee
CCPDS	Command Center Processing and Display System
CCPDS-R	Command Center Processing and Display System Replacement
CCS	(1) Collection Capabilities Statement (HUMINT); (2) COMINT Collection Subsystem (3) Combat Control Squadron; (4) Communications Control Set; (5) Command and Control Systems; (6) Constellation Control Station
CCS2	Command and Control Subordinate System
CCSA	USCENTCOM Scientific and Technical Advisor
CCSC	Cryptologic Combat Support Console
CCT	(1) Combat Control Team; (2) Combat Coordination Team
CCTC	Command and Control Technical Center
CCTF	(1) Contingency Communications Test Facility; (2) Combined Coalition Task Force
CCTP	Continuously Computed Target Point
CCTS	Combat Crew Training Squadron
CCTT	Close Combat Tactical Trainer
CCTV	Closed Circuit Television
CCTW	Combat Control Training Wing
CCWT	Command Center Watch Team
CD	(1) Controlled Dissemination; (2) Certificate of Destruction; (3) Civil Defense; (4) Coastal Defense; (5) Calendar Day; (6) Committee on Disarmament; (7) Collateral Damage; (8) Compact Disc; (9) Command Ship; (10) Counter Drug; (11) Command Director; (12) Combat Developments; (13) Community/Service-Developed
C&D	Cover and Deception
CDA	Congressionally Directed Action
CDC	(1) Career Development Course; (2) Combat Direction Center; (3) Combat Development Center
CD-ROM	Compact Disk-Read-Only Memory
CDAS	Central Data and Applications Support
C-Day	Day in Which Movement From Origin Begins
CDB	Central Data Base
CDCS	Communications Distribution Control Segment

CDE	(1) Conference on Disarmament in Europe; (2) Compound Damage Expectancy; (3) Center of Distance Education
CDEC	Captured Document Exploitation Center
CDF	Central Document File
CDI	Compact Disc Interactive
CDIP	(1) Consolidated Defense Intelligence Program; (2) Council of Defense Intelligence Producers
CDIS	(1) Communications Data Interface System; (2) Counterdrug Intelligence System
CDIST	Canadian Department of Industry, Science, and Technology
CDL	Common (high bandwidth) Data Link
CDLF	Consolidated Domestic Launch Forecast
CDM	Common Digital Map
CDMA	Code Division Multiple Access
CDP	(1) Central Data Processor; (2) Company Distributing Point
CDPS	Coherent Data Processing System
CDR	(1) Critical Design Review; (2) Commander
CDRL	Contract Data Requirements List
CDRUSAJFKSWC	Commander, United States Army John F. Kennedy Special Warfare Center
CDRUSELEMNORAD	Commander, U.S. Element NORAD
CDRWESTCOM	Commander, U.S. Army Western Command
CDS	(1) Chief of Defence Staff (Canadian); (2) Combat Delivery System; (3) Cryptographic Device Services; (4) Combat Direction System
CDSE	Cryptologic Direct Support Element
CDSORG	Civil Direction of Shipping Organization
CDST	C3CM Data Support Team
CDT	(1) Central Daylight Time; (2) Communications Data Terminal
CDTS	Computer-Directed Training System
CDU	Control Display Unit
CDV	Compressed Digital Video
CE	(1) Circular Error; (2) Cost Effectiveness; (3) Civil Engineer; (4) Communications-Electronics; (5) Corps of Engineers (U.S. Army); (6) Current Exploitation; (7) Counterespionage; (8) Command Element; (9) Collection Emphasis
C&E	Collection and Exploitation
C-E	Communications Electronics
CEAO	West African Economic Community
CEC	(1) Cooperative Engagement Capability; (2) Consolidated Expenditure Center
CECOM	Communications and Electronics Command
CED	(1) Collection, Exploitation, and Dissemination; (2) Captured Enemy Document
CEE	Captured Enemy Equipment
CEI	Communications Electronic Instructions

CEL	Celestial
CELT	Current Emitter Location Testbed
CEM	Concepts Evaluation Model
CEMA	Council for Mutual Economic Assistance
CENTAF	(1) Central Region Air Forces (NATO); (2) U.S. Air Force Component, USCENTCOM
CENTAG	Central Army Group (NATO)
CENTAM	Central America
CENTCOM	U.S. Central Command
CENTJIC	Joint Intelligence Center USCENTCOM
CENTLANT	Central Sub-Area of Eastern Atlantic Area
CENTO	Central Treaty Organization
CEO	(1) Communications Electronic Officer (USMC); (2) Chief Executive Officer
CEOI	Communications Electronics Operations Instructions
CEP	(1) Circular Error Probable; (2) Construction Electrician (Power); (3) Common Electronic Parts; (4) Civil Emergency Planning; (5) Committee for Energy Policy of OECD; (6) Capital Equipment Plan; (7) Concept Evaluation Program
CEPG	Combined Exercise Planning Group
CEPIR	Current Exploitation Photographic Interpretation Report
CEPR	Compromising Emanation Performance Requirement
CER	(1) Cryptographic Equipment Room; (2) Communication Equipment Room
CERP	(1) Combined Economic Reporting Program; (2) Capital Equipment Replacement Program
CERT	Computer Security Emergency Response Team
CES	Concept Exploration Studies
CESM	Cryptologic Electronic Warfare Support Measures
CEST	Contingency Exploitation Support Team
CETA	Chinese-English Translation Assistance
CEWI	Combat Electronic Warfare Intelligence
CF	Canadian Forces
C6F	Commander, U.S. Sixth Fleet
C7F	Commander, U.S. Seventh Fleet
CFA	(1) Combined Field Army (Korea); (2) Covering Force Area; (3) Combined Force Air Component Commander
CFB	Canadian Forces Base
CFC	(1) Combined Field Command (Korea); (2) Combined Forces Command (ROK/US); (3) Combined Federal Campaign
CCFC	Commander in Chief, ROK-U.S. Combined Forces Command
CFD	Common Fill Device
CFE	(1) Conventional Forces Europe; (2) Communications Front-End
CFER	CFE Replacement
CFE-U	Communications Front-End-Upgrade
CFI&I	Center for Integration and Interoperability
CFIS	Combined Forces Command Information System, (CFC)

CFL	(1) Coordinated Fire Line; (2) Cease-Fire Line
CFMS	Combat Fuels Management System
CFP	(1) Contingency Force Pool; (2) Concept Formulation Process
CFR	Commander Force Reconnaissance
CFSO	Counterintelligence Force Protection Source Operations
CFSR	Contract Funds Status Report
CFV	Cavalry Fighting Vehicle
cg	Center of Gravity
CG	(1) Guided-Missile Cruiser; (2) Consolidated Guidance; (3) Commanding General; (4) Coast Guard; (4) Chairman's Guidance
CGEUSA	Commanding General, 8th US Army
CGF	Central Group of Forces (FSU Forces in Czechoslovakia)
CGFMFLANT	Commanding General, Fleet Marine Forces Atlantic
CGM	Computer Graphics Metafile
CGN	Guided Missile Cruiser Nuclear Powered
CGS	(1) Coast & Geodetic Survey; (2) Common Ground Station; (3) CONUS Ground Station
CGSC	Command and General Staff College (U.S. Army)
CGUSARPAC	Commanding General U.S. Army Pacific
cGy/hr	CentiGray hour
CH	(1) Aviation Cruiser; (2) Channel; (3) Communication Helmet
CHAALS	Communications High Accuracy Airborne Location System
CHAALS-X	CHAALS Exploitation
CHABNCP	Chief, Airborne Command Post
CHAMPUS	Civilian Health And Medical Program of the Uniformed Services
CHARS	Characters
CHB	Cargo Handling Battalion
CHBDL	Communications High Bandwidth Data Link
CHCMSA	Chief, Cruise Missile Support Activity
CHCSS	(1) Chief, Central Security Service; (2) Chief, Cryptologic Support Service
CHG	Guided-Missile Aviation Cruiser
CHGN	Nuclear-Powered Guided-Missile Aviation Cruiser
CHIP	Communications Handbook for Intelligence Planners
CHJUSMAGK	Chief, Joint U.S. Military Assistance Group, Korea
CHJUSMAGPHIL	Chief, Joint U.S. Military Assistance Group, Philippines
CHJUSMAGTHAI	Chief, Joint U.S. Military Assistance Group, Thailand
CHMAAGDOMREP	Chief, Military Assistance and Advisory Group, Dominican Republic
CHMDO JAPAN	Chief, Military Defense Office, Japan
CHN	Nuclear-Powered Aviation Cruiser
CHODC INDIA	Chief, Office of Defense Cooperation, India
CHOP	(1) Change of Operational Command; (2) Change of Operational Control
C-HUMINT	Counter Human Resources Intelligence

CHUSMLO	Chief, U.S. Military Liaison Office
CI	(1) Counterintelligence; (2) Counterinsurgency; (3) Current Intelligence
C2I	Command, Control, & Intelligence
C3I	Command, Control, Communications, and Intelligence
C4I	Command, Control, Communications, Computers, & Intelligence
C4I2	Command, Control, Communications, Computers, Intelligence and Information
CIA	Central Intelligence Agency
CIAC	Computer Incident Assessment Capability
CIAD	(1) Combat Intelligence Applications Division; (2) Command Intelligence Architecture Document
CIAP	(1) CIA Program; (2) Command Intelligence Architecture/Planning Program
CIARDSCIA	Retirement and Disability System
CIAS	Counterintelligence Analysis Section
CIB	Combat Infantryman's Badge
CIC	(1) Combat Information Center; (2) Combat Intelligence Center; (3) Combined Intelligence Center
C3IC	Coalition Coordination and Communications Integration Center
CICAC	Counterintelligence Control and Analysis Center
CICC	Consolidated Intelligence Communications Center
CIC Server	Combined Intelligence Center Server
CICWS	Combined Intelligence Center Workstation
CID	(1) Criminal Investigation Division; (2) Combat Intelligence Division
CIDBS	Combined Intelligence Center Integrated Database Server
CIDC	Combined Interview and Debriefing Center
CIE	Communication Intercept and Exploitation
CIEF	Consolidated Imagery Exploitation Facility
CIF	(1) Corps Interrogation Facility; (2) Consolidated Intelligence Facility
CIFAX	Enciphered Facsimile
C4IFTW	C4I For The Warrior
CIG	(1) Computer Image Generation; (2) Combined Intelligence Group
CIGSS	Common Imagery Ground Surface System
CIHS	Classified Information Handling System
CIK	Crypto-Ignition Key
CIIC	Current Intelligence and Indications Center
CIID	Command Intelligence Implementation Document
CILMS	Covert Infrared Lighting and Marking System
CILO	Counterintelligence Liaison Office(r)
CILOP	Conversion in Lieu of Procurement
CIM	Corporate Information Management
CIMAS	CENTCOM Iranian Military Activities Summary
CIMEX	Civil Military Exercise (NATO)

C-IMINT	Counter Imagery Intelligence
CIMOC	Civil Military Operations Center
CIMP	COMSEC Interoperability Master Plan
CIN	Cargo Increment Number
CINC	(1) Commander in Chief; (2) Commander of a Combatant Command
CINCACOM	Commander in Chief, U.S. Atlantic Command
CINCAFLANT	Commander in Chief, United States Air Forces, Atlantic
CINCAL	Commander in Chief, Alaska
CINCARLANT	Commander in Chief, United States Army Forces, Atlantic
CINCCENT	Commander in Chief, Allied Forces Central Europe (NATO)
CINCCFC	Commander in Chief, Combined Forces Command, Korea
CINCEASTLANT	Commander in Chief, Eastern Atlantic (NATO)
CINCENT	Commander in Chief, Allied Forces, Central Europe
CINCEUR	Commander in Chief, U.S. Forces Europe
CINCFOR	Commander in Chief, Forces Command
CINCFORSCOM	Commander in Chief, U.S. Army Forces
CINCHAN	Commander in Chief, Channel (NATO)
CINCIBERLANT	Commander in Chief, Iberian Atlantic Area
CINCLANT	Commander in Chief, Atlantic Command
CINCLANTFLT	Commander in Chief, Atlantic Fleet
CINCLANTFLTDETSO	Commander in Chief, Atlantic Fleet Detachment SOUTHCOM
CINCMAC	Commander in Chief, Military Airlift Command (archaic)
CINCNORAD	Commander in Chief, North American Air Defense Command
CINCNORTH	Commander in Chief, Allied Forces Northern Europe (NATO)
CINCONAD	Commander in Chief, Continental Air Defense Command
CINCPAC	Commander in Chief, Pacific Command
CINCPACAF	Commander in Chief, Pacific Air Force
CINCPACFLT	Commander in Chief, Pacific Fleet
CINCPACREP	Commander in Chief, Pacific Representative
CINCSAC	Commander in Chief, Strategic Air Command
CINCSOC	Commander in Chief, Special Operations Command
CINCSO	Commander in Chief, Southern Command
CINCSOUTH	Commander in Chief, Allied Forces Southern Europe (NATO)
CINCSPACE	Commander in Chief, U.S. Space Command
CINCSPECOMME	Commander in Chief, Specified Command, Middle East
CINCTAC	Commander in Chief, Tactical Air Command
CINCTRANS	Commander in Chief, Unified Transportation Command
CINCTRANSCOM	Commander in Chief, U.S. Transportation Command
CINCUKAIR	Commander in Chief, United Kingdom Air Defense Region (NATO)
CINCUNC	Commander in Chief, United Nations Command
CINCUSACOM	Commander in Chief, U.S. Atlantic Command
CINCUSAFE	Commander in Chief, U.S. Air Forces, Europe
CINCUSAREUR	Commander in Chief, United States Army, Europe

CINCUSARPAC	Commander in Chief, United States Army, Pacific
CINCUSNAVEUR	Commander in Chief, U.S. Naval Forces, Europe
CINCWESTLANT	Commander in Chief, Western Atlantic (NATO)
CINF	Community Imagery Needs Forecast
CINSGCY	Counterinsurgency
CIO	(1) Central Imagery Office; (2) Chief Information Officer
CIOC	(1) Combined Intelligence Operations Center (Korea); (2) Combat Intelligence Operations Center
CIOP	(1) Controlled Intelligence Operational Proposal; (2) CIO Program
CIP	(1) Consolidated Intelligence Program; (2) Country Information Package; (3) Critical Intelligence Parameter; (4) Combined Interoperability Program; (5) Crypto-Ignition Plug; (6) Correlation and Integration Processor
CIPE	(US) CENTCOM Imagery Production Element
CIPEC	Intergovernmental Council of Copper Exporting Countries
CIPHONY	Enciphered Telephone
CIPL	ClNC's Integrated Priority List
CIPMS	Career Intelligence Professional Management System
CIPR	(1) Consolidated Intelligence Production Requirement; (2) Counterintelligence Production Registry
CIPS	Counterintelligence Periodic Summary
C2IPS	C2 Information Processing System
CIR	(1) Central Intelligence Report; (2) Continuing Intelligence Requirement
CIRC	Central Information Reference and Control
CIRCOL	Central Information Reference and Control On-Line System
CIRIS	Consolidated Intelligence Resources Information System
CIRK	Common Interswitch Rekeying Key
CIRL	Current Intelligence Requirements List
CIRT	Computer Security Incident Response Team
CIRVlS	Communications Instructions for Reporting Vital Intelligence Sightings
CIS	(1) Country Intelligence Study; (2) Communications Intercept System; (3) Compensated Imaging System; (4) Canadian Intelligence Service; (5) Chief, Intelligence and Security (Canadian); (6) Combat Instruction Set; (7) Combat Information System; (8) Commonwealth of Independent States; (9) Combat Intelligence System
CISA	C4I Integration Support Activity
CISC	Counterintelligence Support Cell
C3ISC	C3I Systems Committee
CI/SCM	Counterintelligence and Security Countermeasures
CISD	Command Intelligence Strategy Document
CISE	(1) (US) CENTCOM Intelligence Support Element; (2) Corps Intelligence Support Element
CISO	(1) Counterintelligence Support Officer; (2) Counterintelligence Staff Officer
CISPOTREP	CI Spot Report

CISR	Communications Intelligence Security Regulation
C4ISR	Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance
CIT	Counterintelligence Team
CITA	Combat Intelligence and Targeting on Arrival
CITS	CENTCOM Imagery Transmission System
CIV	Civilian
CIVC	Carrier Intelligence Center
CIVIC	Civilian Vulnerability Indicator Code
CISION	Enciphered Television
CIW	(1) Consolidated Intelligence Watch; (2) CMOC Intelligence Watch
CIWC	CIW Commander
CIWG	Cooperative Interaction Working Group
CIWS	Close-In Weapon System
C&J	Collection and Jamming
CJB	Congressional Justification Book
CJCS	Chairman, Joint Chiefs of Staff
CJCSI	Chairman, Joint Chiefs of Staff Instruction
CJIATF-E	Commander, Joint Interagency Task Force-East
CJIATF-W	Commander, Joint Interagency Task Force-West
CJIT	Combined Joint Interrogation Team
CJTF	Commander, Joint Task Force
CJTF-AK	Commander, Joint Task Force-Alaska
CJTF-FA	Commander, Joint Task Force-Full Accounting
CK	Compartment Key
CKG	Cooperative Key Generation
CL	Light Cruiser
C-LAMP	Community Laser Measurement Program
CLASS	Close Air Support System
Class	Classification/Classified
C&LB	Coasts and Landing Beaches
CLF	Commander, Landing Force
CLMD	COMSEC Local Management Device
CLNC	Clearance
CLO	(1) Counterdrug Liaison Officer; (2) Chief Logistics Officer
CLOCE	Contingency Lines of Communication, Europe
CLS	(1) Contractor Logistics Support; (2) Clandestine Lighting System
CLSC	COMSEC Logistics Support Center
CLSP	Composite Launch Sequence Plan
CL/TECH	Clear Language Technical Report
cm	Centimeter
CM	(1) Memorandum by the Chairman, Joint Chiefs of Staff; (2) Collection Management; (3) Countermeasure(s); (4) Cruise Missile; (5) Collection Manager; (6) Collection Management Division; (7) Countermine; (8) Countermine Activities

CMA	(1) Countermission Analysis; (2) Collection Management Authority; (3) Community Management Account
CMAA	(1) Command Master at Arms; (2) Chief Master at Arms
CMAFB	Cheyenne Mountain Air Force Base
CMAFS	Cheyenne Mountain Air Force Station
CMAH	CINC Mobile Alternate Headquarters
CMAS	Cheyenne Mountain Air Station
C-MASINT	Counter-Measures and Signature Intelligence
CMB	Collection Management Branch
CMC	(1) Cheyenne Mountain Complex; (2) Commandant, U.S Marine Corps; (3) Command Master Chief
C/MC	Command Master Chief
CMCA	Cruise Missile Carrier Aircraft
CMCC	(1) Commander in Chief, Mobile Command Center; (2) Component Mobile Command Center
CMCDS	Community Multilateral Counterterrorism Database System
CMCI	Computed Mission Coverage Index
CMCM	Commandant, U.S. Marine Corp Memorandum
CMCS	(1) COMSEC Material Control System; (2) COMINT Mission Control System
CMD	(1) Collection Management Division; (2) Command
CMDC	Command Cell
CMDR	Commander
CM&D	Collection Management and Dissemination
CME	Communications Monitoring Equipment
CMEA	Council for Mutual Economic Assistance
CMEC	Captured Material Exploitation Center
CMF	Combat Mission Folder
CMFC	Combined Marine Forces Command
CMIC	Combined Military Interrogation Center
CMISE	Corps Military Intelligence Support Element
CML	Chemical
CMO	(1) Collection Management Office; (2) Civil Military Operations; (3) Central MASINT Office
CMOC	(1) Cheyenne Mountain Operations Center; (2) Civil Military Operations Center; (3) Central MASINT Operations Cell
CMOS	Complementary Metal-Oxide Semiconductor
CMOTF	Civil Military Operations Task Force
CMP	(1) Combat Mission Planning; (2) Configuration Management Plan
CMPF	Confidential Military Purpose Funds
CMPS	Compartmented Mode Processing System
CMR	Crisis Management Room
CMRS	Collection Management Requirements System
CMS	(1) Combat Mission Section; (2) Command and Management System; (3) Community Management Staff; (4) Collection Management System; (5) Common Mapping Standard

CMS/RMG	Community Management Staff, Resource Management Group
CMSA	Cruise Missile Support Activity
CMSI	Civilian Multi-Spectral Imagery
CMSS	Collection Management Support System
CMST	(1) Collection Management Support Terminal; (2) Collection Management System Tools
CMT	(1) Crisis Management Team; (2) Critical Mobile Target
CMTC	Combat Maneuver Training Center
CMTC-IS	CMTC-Instrumentation System
CMTS	(1) Critical Mobile Target Server; (2) Compliance Monitoring Tracking System
CMW/CMWS	Compartmented Mode Workstation
CN	Counternarcotics
CNA	(1) Center for Naval Analysis; (2) Coordinates Not Available; (3) Critical Node Analysis
CNAC	(1) Customs National Air Command, Oklahoma City; (2) Customs National Aviation Center
CNAD	Conference on NATO Armament Directors
CNAVSPACECOM	Commander, Navy Space Command
CNC	(1) Counternarcotics Center; (2) Computerized Numerical Control
CNCS	Cryptonet Control Station
CN-CMS	Counternarcotics Command and Management System
CNES	Centre National d'Etudes Spatiales (French National Space Agency)
CNET	(1) Chief of Naval Education and Training; (2) Centre National d'Etudes Des Telecommunications
C3NET	Command, Control, and Communications Networks
CNFJ	Commander, U.S. Naval Forces Japan
CNFK	Commander, U.S. Naval Forces Korea
CNFM	Commander, U.S. Naval Forces Marianas
CNI	(1) Communicating NATO Intentions; (2) Communications, Navigation, or Identification
CNIC	Combined Naval Intelligence Center
CNIN	Composite Network, Front-End Internal Network
CNIPS	Counternarcotics Information Processing System
CNK	Cryptonet Key
CNMI	Commonwealth of the Northern Mariana Islands
CNN	Cable News Network
CNO	Chief of Naval Operations
C/No	Ratio of carrier to noise in a 1Hz bandwidth
CNOC	(1) Counternarcotics Operations Center; (2) Combined Naval Operations Center
CNOM	Chief of Naval Operations Memorandum
CNOR	Command Not Operationally Ready
CNR	(1) Chief of Naval Research; (2) Combat Net Radio
CNRIU	Combat Net Radio Interface Unit
CNS	Commercial Network Survivability

CNSWTG	Commander, Naval Special Warfare Task Group
CNTL	Command Nuclear Target List
CNVFD	Color Night Vision Fusion Device
CNWDI	Critical Nuclear Weapons Design Information
CO	(1) Commanding Officer; (2) Company
CO3	Combined Staff Public and Governmental Affairs Officer
CO6	Combined Staff Judge Advocate
CO7	Combined Staff Command Surgeon
COA	Course of Action
COB	(1) Close of Business; (2) Collated Operating Base; (3) Chief of Base; (4) Command Operating Budget
COBE	Cosmic Background Explorer
COBOL	Common Business Oriented Language
COC	Combat Operations Center
COCOM	(1) Coordinating Committee; (2) Combatant Command
COD	Carrier On-board Delivery
CODIS	Continuity of Defense Intelligence Systems
COE	Common Operating Environment
COEA	Cost and Operational Effectiveness Analysis
COFIR	Compendium of Future Intelligence Requirements
COFs	Central Operating Facilities
CofS	Chief of Staff
COG	(1) Combined Operations Group; (2) Continuity of Government; (3) Center of Gravity
COI	Communities of Interest
COIC	Combat Operations Intelligence Center (USAFE)
COIN	Counterinsurgency
COINS	(1) Consolidated On-Line Intelligence System; (2) Community On-Line Intelligence Network Systems
COINS-II	Community On-Line Intelligence System-II
COIR	Commander's Operational Intelligence Requirements
COIS	Combat Operations Intelligence System
COLISEUM	Community On-Line Intelligence System for End Users and Managers
COLL	Collection
COLLECT	Collection
COLOP	Collection Opportunity (messages)
COLT	Combat Observation and Laser Team
COM	(1) Computer Output to Microform; (2) Chief of Mission (U.S. Embassy); (3) Collection Operations Management; (4) Commander
COMA	Court of Military Appeals
COMACC	Commander, Air Combat Command
COMAAFCE	Commander, Allied Air Forces Central Europe
COMAFFOR	Commander, Air Force Forces
COMAFOSI	Commander, Air Force Office of Special Investigations

COMAFSOC	Commander, U.S. Air Force Special Operations Command
COMAFSPACE	Commander, Air Force Space Command
COMALCOM	Commander, Alaskan Command
COMAMC	Commander, Air Mobility Command
COMARSPACECOM	Commander, Army Space Command
COMASPC	Commander, Air Force Space Command
COMAINT	Command Maintenance
COMAIR-BALTAP	Commander, Allied Air Forces, Baltic Approaches
COMAIRSOUTH	Commander, Allied Air Forces, Southern Europe
COMALCOM	Commander, Alaskan Command
COMALF	Commander of Airlift Forces
COMANR	Commander, Alaskan NORAD Region
COMANTDEF-COM	Commander, Antilles Defense Command
COMARFOR	Commander, Army Forces
COMARSOC	Commander, U.S. Army Special Operations Command
COMARSOF	Commander, U.S. Army Special Operations Forces
COMATF	Commander, Amphibious Task Force
COMBALTAP	Commander, Allied Forces, Baltic Approaches
COMBAT DF	Combat Direction Finding
COMBENE-CHAN	Commander, Benelux Sub-Area Channel
COMBISCLANT	Commander, Bay of Biscay Submarine Area
COMCANLANT	Commander, Canadian Atlantic Submarine Area
COMCARGRU	Commander Carrier Group
COMCENTAG	Commander, Central Army Group, Central Europe
COMCENTLANT	Commander, Central Submarine Area
COMCM	Communication Countermeasures & Deception
COMCO	Canadian SSO
COMCRUDESGRU	Commander Cruiser Destroyer Group
COMDT COGARD	Commandant, U.S. Coast Guard
COMECON	Council for Mutual Economic Assistance
COMEDCENT	Commander, Central Mediterranean Area
COMEDEAST	Commander, Eastern Mediterranean Area
COMEDNOREAST	Commander, Northeast Mediterranean Area
COMEDOC	Commander, Western Mediterranean Area
COMEDS	CONUS Meteorological Data System
COMEDSOUEAST	Commander, Southeast Mediterranean Area
COMEX	(1) Committee on Exchanges; (2) Communications Exercise
COMFAIRKEF	Commander, Fleet Air Keflavik
COMFIVEATAF	Commander, Fifth Allied Tactical Air Force, Southern Europe
COMFLDCOMDASA	Commander, Field Command, Defense Atomic Support Agency
COMFOURATAF	Commander, Fourth Allied Tactical Air Force Central Europe
COMGIB	Naval Commander, Gibraltar
COMGIBMED	Commander, Gibraltar Mediterranean Command
COMGTMODEFCOM	Commander, Guantanamo Defense Command
COMICEDEFOR	Commander, Iceland Defense Force

COMIDEASTFOR	Commander, Middle East Force (USN)
COMINEWARCOM	Commander, Mine Warfare Command
COMINT	Communications Intelligence
COMINTADTSK	COMINT Advisory Tasking Message
COMIREX	Committee on Imagery Requirements and Exploitation
COMIS	Collection Management Information System
COMJAM	Communications Jamming
COMJSOC	Commander, Joint Special Operations Command
COMJSOTF	Commander, Joint Special Operations Task Force
COMJTF	Commander, Joint Task Force
COMJUWATF	Commander, Joint Unconventional Warfare Task Force
COML	Commercial
COMLANDFOR	Commander, Land Forces
COMLANDJUT	Commander, Allied Land Forces, Schleswig-Holstein & Jutland
COMLANDNORWAY	Commander, Allied Land Forces, Norway
COMLANDSOUTH	Commander, Allied Land Forces, Southern Europe
COMLANDZEALAND	Commander, Allied Land Forces, New Zealand
COMLANTAREA	Commander, Coast Guard Atlantic Area
COMLOGNET	Combat Logistics Network
COMM	(1) Communication; (2) Commercial
COMM(S)	Communication(s)
COMMAIRCHAN	Commander, Allied Maritime Air Force, Channel
COMMAIRNORLANT	Maritime Air Commander, Northern Submarine Area
COMMARBASPAC	Commander, Marine Corps Base, Pacific
COMMARDEZSECAK	Commander, U.S. Maritime Defense Zone Sector, Alaska
COMMARFOR	Commander, Marine Forces
COMMARFORJAPAN	Commander, Marine Forces, Japan
COMMARFORK	Commander, Marine Forces, Korea
COMMARFORPAC	Commander Marine Corps Forces, Pacific
COMMARFORSOUTH	Commander, Marine Corps Forces, South
COMMCEN	Communications Center
COMMDET	Communications Detachment
COMMO	Communications
COMMS CTR	Communications Center
COMMZ	Communications Zone
COMNAVAIR	Commander, Naval Air Forces
COMNAVAIRLANT	Commander, Naval Air Forces, Atlantic
COMNAVAIRPAC	Commander, Naval Air Forces, Pacific
COMNAVBALTAP	Commander, Allied Naval Forces, Baltic Approaches
COMNAVFOR	Commander, Naval Forces
COMNAVFORK	Commander, Naval Forces, Korea
COMNAVINTCOM	Commander, Naval Intelligence Command
COMNAVLOG	Commander, Naval Logistics
COMNAVMARIANAS	Commander, Naval Forces, Marianas
COMNAVNON	Commander, Allied Naval Forces, North Norway

COMNAVSCAP	Commander, Allied Naval Forces, Scandinavian Approaches
COMNAVSEASYSCOM	Commander, Naval Sea Systems Command
COMNAVSECGRU	Commander, Naval Security Group
COMNAVSOF	Commander, Naval Special Operations Forces
COMNAVSPACECOM	Commander, Naval Space Command
COMNAVSPECWARCOM	Commander, Naval Special Warfare Command
COMNAVSURF	Commander, Naval Surface Forces
COMNAVSURFLANT	Commander, Naval Surface Force, U.S. Atlantic Fleet
COMNAVSURFPAC	Commander, Naval Surface Force, Pacific
COMNORECHAN	Commander, Northern Submarine Area, Channel
COMNORLANT	Commander, Northern Submarine Area
COMNORTHAG	Commander, Northern Army Group, Central Europe
COMNSWU	Commander, Naval Special Warfare Unit
COMOCEANLANT	Commander, Ocean Atlantic
COMOCEANSYSLANT	Commander, Oceanographic Systems Atlantic
COMOCEANSYSPAC	Commander, Oceanographic Systems Pacific Company
COMOPS	Communications Operations Summary
COMP	Compatible
COMPACAF	Commander, Pacific Air Forces
COMPASS	Computerized Movement Planning and Status System
COMPATWINGSLANT	Commander, Patrol Wings Atlantic
COMPHIBGRU	Commander, Amphibious Group
COMPLYMCHAN	Commander, Plymouth Submarine Area, Channel
COMPUINT	Computer Intelligence
COMPUSEC	Computer Security
COMPW	Composite Wing
COMPWING	Composite Wing
COMS	Collection Operations Management System (HUMINT)
COMSAT	Communications Satellite
COMSC	Commander, Military Sealift Command
COMSEC	Communications Security
COMSECONDFLT	Commander, U.S. Second Fleet
COMSEVENTHFLT	Commander, U.S. Seventh Fleet
COMSIXATAF	Commander, Sixth Allied Tactical Air Force, Southeastern Europe
COMSIXTHFLT	Commander, U.S. Sixth Fleet
COMSOC	Commander, Special Operations Command
COMSOC-K	Commander, Special Operations Command, Korea
COMSOCEUR	Commander, Special Operations Command, Europe
COMSOCLANT	Commander, Special Operations Command, Atlantic
COMSOCPAC	Commander, Special Operations Command, Pacific
COMSOCSOUTH	Commander, Special Operations Command, Southern Command
COMSOTFE	Commander, Support Operations Task Force, Europe
COMSPOT	Communications Spot Report
COMSTAT	Communication Status Report

COMSTRATCOMWING ONE	Commander, Strategic Communications Wing One
COMSTRICKFLANT	Commander, Striking Fleet Atlantic (Afloat)
COMSTRIKFLTLANT	Commander, Striking Fleet, Atlantic
COMSTRIKFORSOUTH	Commander, Striking Force, South
COMSTS	Commander, Military Sea Transportation Service
COMSUBACLANT	Commander, Submarine Forces, Allied Command, Atlantic
COMSUBEASTLANT	Commander, Submarine Force, Eastern Atlantic
COMSUBGRU	Commander, Submarine Group
COMSUBGRU 8/CTF MED	Commander Submarine Group (Mediterranean)/Commander Task Force Mediterranean
COMSUBLANT	Commander, Submarine Force, U.S. Atlantic Fleet
COMSUBMED	Commander, Submarines, Mediterranean
COMSUBPAC	Commander, Submarine Forces, Pacific
COMSUBWESTLANT	Commander, Submarine Force, Western Atlantic Area
COMSUPNAVFOR	Commander, Supporting Naval Forces
COMTAFNORNOR	Commander, Allied Tactical Air Force, North Norway
COMTAFSONOR	Commander, Allied Tactical Air Force, South Norway
COMTASKFORNON	Commander, Allied Task Force, North Norway
COMTECHREP	Complementary Technical Report
COMTHIRDFLT	Commander, Third Fleet
COMTRAPAC	Commander, Training Command, Pacific
COMTWOATAF	Commander, Second Allied Tactical Air Force, Central Europe
COMUKADR	Commander, UK NATO Air Defense Region
COMUSAFAK	Commander, U.S. Air Forces, Alaska
COMUSAFFOR	Commander, United States Air Force Forces
COMUSAFJ	Commander, U.S. Air Forces, Japan
COMUSAFK	Commander, U.S. Air Forces, Korea
COMUSAFTF	Commander, United States Air Force Task Force
COMUSARAK	Commander, U.S. Army Forces, Alaska
COMUSARCENT	Commander, U.S. Army Forces Central Command
COMUSARFOR	Commander, United States Army Forces
COMUSARSO	Commander, United States Army Forces Southern Command
COMUSARSPACE	Commander, U.S. Army Space Command
COMUSARTF	Commander, United States Army Task Force
COMUSASOC	Commander, U.S. Army Special Operations Command
COMUSFOR KOREA	Commander, U.S. Forces Korea
COMUSFK	Commander, U.S. Forces, Korea
COMUSFORAZ	Commander, U.S. Forces, Azores
COMUSFORCARIB	Commander, U.S. Forces, Caribbean
COMUSFORCNTY	Commander US Forces Country
COMUSJ	Commander, U.S. Forces, Japan
COMUSJAPAN	Commander, U.S. Forces, Japan (also COMUSJ)
COMUSJTF	Commander, United States Joint Task Force
COMUSJUWTF	Commander, United States Joint Unconventional WarfareTask Force

COMUSKOREA	Commander, U.S. Forces, Korea (also COMUSK)
COMUSLANDFOR	Commander, United States Land Forces
COMUSMACTHAI	Commander, United States Military Assistance Command, Thailand
COMUSMARCENT	Commander, U.S. Marine Forces Central Command
COMUSMARDEZLANT	Commander, U.S. Maritime Defense Zone, Atlantic
COMUSMARDEZPAC	Commander, U.S. Maritime Defense Zone, Pacific
COMUSMARFOR	Commander, United States Marine Forces
COMUSMARTF	Commander, United States Marine Task Force
COMUSMILGP	Commander, United States Military Group
COMUSNAVAK	Commander, U.S. Naval Forces, Alaska
COMUSNAVCENT	Commander, U.S. Naval Forces, Central Command
COMUSNAVEUR	Commander, U.S. Naval Forces, Europe
COMUSNAVFOR	Commander, United States Naval Forces
COMUSNAVPHIL	Commander, U.S. Naval Forces, Philippines
COMUSNAVSO	Commander, U.S. Naval Forces South
COMUSNAVTF	Commander, United States Naval Task Force
COMZEALAND	Commander, Allied Land Forces, New Zealand
CON	Control(led)
CONAD	Continental Air Defense Command
CONDECA	Central America Defense Council
CONF	Confidential
CONFIG	Configuration
CONG	Congress
CONGEN	Consul General
CONGINT	Congressional Interest
ConNMJIC	Contingency NMJIC
CONOBJTR	Conscientious Objector
CONOP(S)	Concept of Operation(s)
CONOPS	(1) United States Army Intelligence Command Continental (United States) Operations; (2) Concept of Operations
CONPG	Chairman, Operational Nuclear Planning Group
CONPLAN	(1) Concept Plan; (2) Contingency Plan
CONR	CONUS NORAD Region
CONTEXT	Conferencing and Text Manipulation System
CONTRA-	Against, Opposite (Prefix)
CONUS	Continental United States
CONUSA	Continental United States Army
CONVL	Conventional
COOP	Continuity of Operations Plan
COORD	Coordination
COP	(1) Command Observation Post; (2) Crashout Package
COPG	Chairman, Operational Planners Group
COPRA	Comparative Postwar Recovery Analysis
COPRL	Command Operations Priority Requirements List

COPSTRAT	Continuity of Operations Plan (USSTRATCOM)
COR	(1) Command Operationally Ready; (2) Central Office of Record; (3) Contracting Officer's Representative
CORCEN	Correlation Center
CORE	Contingency Response (Program)
CORL	(1) Collection Opportunity Requirements List; (2) Chief of Receive Location
CORM	Commission on Roles and Missions
CORPS SAM	Corps Surface-to-Air Missile
CORTRAIN	Corps/Division Training Coordination Program
COS	(1) Combat Operations Staff; (2) Chief of Station; (3) Chief of Staff; (4) Communications Segment
cos	Cosine
COSAL	Consolidated Ship/Squadron Allowance
COSCOM	Corps Support Command
COSIN	Control Staff Instructions
COSA	Commander, Oceanographic Systems, Atlantic
COSP	Commander, Oceanographic Systems, Pacific
COSPO	Community Open Source Program Office Cotangent
COTP	Captain of the Port
COTR	Contracting Officer's Technical Representative
COTS	(1) Commercial Off-the-Shelf; (2) Container Offloading Transfer System
COUNTERMASINT	Counter Measurements and Signature Intelligence
COVCOM	Covert Communications
CoVRT	Commanders (and Staff) Visualization Research Tool
CP	(1) Contingency Planning; (2) Command Post; (3) Character Position; (4) Communications Processor; (5) Central Processor; (6) Career Program; (7) Counterproliferation
C&P	Characteristics and Performance
C-P	Counterproliferation
CPA	(1) Chairman's Program Assessment; (2) Collection Planning Aid; (3) CJCS Preparedness Assessment
CPAT	Collection Planning and Targeting
CPB	Charged Particle Beam
CPBS	(1) Capabilities Programming and Budgeting System; (2) Consolidated Program and Budgeting System
CPC	(1) Coastal Patrol Boat; (2) Collection and Processing Center; (3) Central Processing Center
CPE	(1) Circular Probable Error; (2) Central Production Element
CPFL	Contingency Planning Facilities List
CPI	Communications Processor and Interface
CPIA	Chemical Propulsion Information Agency
CPIC	Coastal Patrol and Interdiction Craft
CPM	Cycles Per Minute
CPMIEC	China Precision Machinery Import Export Corporation
CPNET	Custom Product Network

CPO	(1) Command Project Officer; (2) Chief Petty Officer
CPP	Communist Party of the Philippines
CPR	(1) Cardio-Pulmonary Resuscitation; (2) Chairman's Program Recommendations
CPS	(1) Collection Problem Set; (2) Correlation Processing Subsystem; (3) Characters Per Second; (4) COMSEC Parent Switch; (5) Craft Positioning System
CPSB	Career Program Selection Board
CPSS	Computer Systems Squadron
CPSU	Communist Party of the Soviet Union
CPT	Command Post Terminal
CPU	(1) Central Processing Unit; (2) Communications Processing Unit; (3) Computer Processing Unit
CPX	Command Post Exercise
CP OSCAR	Command Post Operations Support Center and Rear
CP TANGO	Command Post Tactical Air, Naval, Ground Operations
CQB	Close Quarter Battle
C-QUIP	Combined Quarterly Intelligence Production Listing
CR	(1) Crisis Relocation; (2) Combat Radius; (3) Collection Request; (4) Close Range; (5) Collections Requirement
CRAF	Civil Reserve Air Fleet
CRB	Contingency Reference Book
CRBIF	Crisis Basis Imagery File
CRC	(1) Command and Reporting Center; (2) Control and Reporting Center; (3) CONUS Replacement Center
CRDC	United States Army Chemical Research & Development Center
CRDL	Collateral Recurring Document Listing
CRE	(1) Combat Readiness Evaluation; (2) Control and Reporting Element
CREST	Covert Reconnaissance/Strike
CRF	(1) Crisis Response Force; (2) Cable Reports File
CRIMP	Crisis Management Plan
CRIS	Command Resources Information System
CRISCON	Crisis Condition (I&W System)
C-RISTA	Counter-Reconnaissance, Intelligence, Surveillance, and Target Acquisition
CRITIC	(1) Critical Intelligence; (2) Critical Intelligence Message; (3) Critical Intelligence Communication
CRITICOM	Critical Intelligence Communications Network
CRJOIC	Central Region Joint Operational Intelligence Center
CRL	Certificate Revocation List
CRM	Collection Requirements Management
CRMA	Collection Requirements Management Architecture/Application
CRMO	Collection Requirements Management Office(r)
CRMP	Collection Requirements Management Program or Plan
CRMS	Collection Requirements Management System
CRN	Combat Radio Net

CROF	Crete Remote Operating Facility
CROM	Continuous Read-Only Memory
CRP	(1) Control and Reporting Post; (2) COMSEC Resources Program
CRRC	Combat Rubber Raiding Craft
CRRES	Combined Release and Radiation Effects Satellite
CRRS	Customer Requirements Registration System
CRS	(1) COMIREX Requirements Structure; (2) Combined Recording Site; (3) Comprehensive Retrieval Subsystem; (4) Catholic Relief Service; (5) Congressional Research Service; (6) Community Relations Service
CRT	(1) Cathode Ray Tube (Terminal); (2) Combat Readiness Training; (3) Crisis Response Team
CRTA	Chief of Rocket Troops and Artillery
CRUDESGRU	Cruiser-Destroyer Group
CRWG	Current Requirements Working Group
CRYPTO	(1) Cryptography/Cryptographic; (2) Cryptologic
CS	(1) Combat Support; (2) Communications Subsystem; (3) Constant Source; (4) Chief of Staff; (5) Central Servers; (6) Coalition Support
CS1	Critical-Sensitive Level 1
CSA	(1) Chief of Staff, U.S. Army; (2) Central Supplies Agency of NATO; (3) Corps Support Activity; (4) Combat Support Agency(ies)
CSABE	Central and South African Basic Encyclopedia
CSAF	Chief of Staff, U.S. Air Force
CSAFM	Chief of Staff, Air Force Memorandum
CSAM	Chief of Staff, Army Memorandum
CSAR	Combat Search and Rescue
CSAW	Cryptologic Support to Amphibious Warfare
CSB	(1) Close Silo Basing; (2) Collection Support Brief (HUMINT); (3) Current Situation Branch
CSBR	Commander, Special Boat Squadron
CSC	(1) Community Support Center; (2) Customer Support Center; (3) Combat Support Cell
CSCE	Conference on Security and Cooperation in Europe
CSCG	Communications Security Control Group
CSCI	(1) Commercial Satellite Communications Initiative; (2) Computer Software Configuration Interface
CSCR	Computer System Change Request
CSDS	Command Spatial Display System
CSCT	Combat Support Coordination Team
CSE	(1) Cryptologic Support Element(s); (2) Command Support Element; (3) Client Server Environment; (4) Canadian SIGINT Establishment; (5) Communi-cations Security Element
CSE-SS	Client Server Environment-System Services
CSEL	Combat Survivor-Evader Locator
CSENCNET	Satellite Education Network
CSF	Command Support Functions

CSFOCI	Force Protection Operations
CSG	(1) Cryptologic Support Group; (2) Chairman's Staff Group; (3) Combat Support Group; (4) Corps Support Group
CSG-SOCOM	Cryptologic Support Group/USSOCOM
CSGN	Nuclear Strike Cruiser
CSI	Commercial Satellite Interconnectivity
C-SIGINT	Counter Signals Intelligence
CSIS	Canadian Security and Investigative Service
CSMA/CD	Carrier Sense Multiple Access with Collision Detection
CSMO	Cryptologic Support to Military Operations
C3SMP	Command, Control, Communications System Master Plan
CSMR	Coarse Spatial Resolution, Multispectral
CSOC	Consolidated Space Operations Center
CSP	(1) Communications Support Processor; (2) Crisis Staffing Procedures; (3) Contingency Support Package
CSP/HOL	Communications Support Processor/High Order Language
CSPAR	(1) Central Strategic Processing, Analysis, and Reporting; (2) CINC's Preparedness Assessment Report
CSPO	Consolidated SAFE Project Office
CSR	(1) Current Situation Room; (2) Coastal Surveillance Radar; (3) Controlled Supply Rate; (4) Collection Support Requirement; (5) Combat Search & Rescue
CSRD	Communication-Computer Systems Requirement Document
CSRS	Civil Service Retirement System
CSS	(1) Communications Security System; (2) Communications Support System; (3) Central Security Service; (4) Combat Service Support; (5) Collateral Support System; (6) Contingency Support Study; (7) Communications System Segment; (8) Common Sensor System; (9) COMSEC Subordinate Switch; (10) Combat Surveillance Service; (11) Continuous Signature Service; (12) Coded Switch System; (13) Command Specific Server
CSSA	Cryptologic Shore Support Activity
CSSCS	(1) Combat Service Support Control System; (2) Combat Service Support Computer System
CSSD	Combat Service Support Detachment
CSSE	Combat Service Support Element
CSSO	Contractor Special Security Officer
CSSP	Combined Services Support Program
CSSOC	Combat Service Support Operations Center
CSSR	CSS Replacement
CSST	Combat Service Support Team
CST	(1) Central Standard Time; (2) Coastal Survey Team; (3) Coalition Support Team
CSTC	Consolidated Space Test Center
CSTIP	Combined Strategic Intelligence Training Program
CSTOL	Cargo Short Take-Off & Landing
CSTVRP	Computer Security Technical Vulnerability Reporting Program
CT	(1) Training Cruiser; (2) Counterterrorism; (3) Combating Terrorism; (4) Cryptologic Technician

CTA	(1) Central Technical Authority; (2) Common Table of Allowances
CTAI	Continuous-Tone Aerial Imagery
CTAK	Cypher-Text Auto-Key
CTAPS	Contingency Theater Automated Planning System
CTB	Comprehensive Test Ban
CTBT	Comprehensive Test Ban Treaty
CTC	(1) Combat Targeting Center; (2) Counterterrorism Center; (3) Combat Training Center
CTD	(1) Collective Training Directorate; (2) Charge Transfer Device
CTDR	Commercial Training Device Requirements
CT&E	Certification Test and Evaluation
CTE	Coefficient of Thermal Expansion
CTEA	Cost and Training Effectiveness Analysis
CTF/JTF	(1) Crisis Task Force; (2) Commander Task Force; (3) Central Training Flight; (4) Combined Task Force; (5) Joint Task Force; (6) Consolidated Training Facility
CTF-B	Combined Task Force-Bomber
CTF-BM	Combined Task Force-Battle Management
CTF-C2	Combined Task Force Director of Intelligence
CTF PC II	CTF Provide Comfort II
CTG	Commander, Task Group
